

Tension Controller

LE7-40GU
INSTRUCTION MANUAL (Communication)

SAFETY PRECAUTIONS

(Read these precautions before use.)

Before using this product, please read this manual and the relevant manuals introduced in this manual carefully and pay full attention to safety in order to handle the product correctly.

This manual classifies the safety precautions into two categories: [⚠️ WARNING] and [⚠️ CAUTION].

 WARNING	Indicates that incorrect handling may cause hazardous conditions, resulting in death or severe injury.
 CAUTION	Indicates that incorrect handling may cause hazardous conditions, resulting in minor or moderate injury or property damage.

Depending on the circumstances, procedures indicated by [⚠️ CAUTION] may also cause severe injury.

It is important to follow all precautions for personal safety.

Store this manual in a safe place so that it can be read whenever necessary. Always forward it to the end user.

[DESIGN PRECAUTIONS]

WARNING

- Make sure to set up the following safety circuits outside the tension controller to ensure safe system operation even during external power supply problems or tension controller failure. Otherwise, malfunctions may cause serious accidents.
 - Note that when an error occurs in a relay or transistor of an output circuit, the output might stay on or off. For output signals that may lead to serious accidents, external circuits and mechanisms should be designed to ensure safe machinery operation in such a case.
 - Most importantly, set up the following: an emergency stop circuit, a protection circuit, an interlock circuit for opposite movements (such as normal vs. reverse rotation), and an interlock circuit (to prevent damage to the equipment at the upper and lower torque limits and upper and lower tension limits).
 - In an output circuit, when a load current exceeding the current rating or an overcurrent caused by a load short-circuit flows for a long time, it may cause smoke and fire. To prevent this, configure an external safety circuit, such as a fuse.
 - For the operating status of each station after a communication failure of the network, refer to relevant manuals for the network. Incorrect output or malfunction may result in an accident.
-

[DESIGN PRECAUTIONS]

CAUTION

- If a power failure or an abnormal voltage drop occurs, the tension controller stops, and output is turned off.
-

[INSTALLATION PRECAUTIONS]

WARNING

- Make sure to cut off all phases of the power supply externally before attempting installation or wiring work. Failure to do so may cause electric shock or damage to the product.
 - Use the product within the generic environment specifications described in LE7-40GU APPLICATION MANUAL (SH-081822ENG). Never use the product in areas with excessive dust, oily smoke, conductive dusts, corrosive gas (salt air, Cl₂, H₂S, SO₂ or NO₂), flammable gas, vibration or impacts, or expose it to high temperature, condensation, or rain and wind. If the product is used in such conditions, electric shock, fire, malfunctions, deterioration or damage may occur.
-

[INSTALLATION PRECAUTIONS]

CAUTION

- Do not touch the conductive parts of the product directly. Doing so may cause device failures or malfunctions.
 - Always wear an anti-static wristband and discharge static electricity from the body before handling the extension option. Failure to do so may cause the extension option to fail or malfunction.
 - When drilling screw holes or wiring, make sure that cutting and wiring debris do not enter the ventilation slits of the tension controller. Failure to do so may cause fire, equipment failures or malfunctions.
 - Install the product on a flat surface. If the mounting surface is rough, undue force will be applied to the PC board, thereby causing nonconformities.
 - Install the product securely using mounting screws or fixtures.
 - Connect the extension options securely to their designated connectors. Loose connections may cause malfunctions.
 - Make sure to affix the extension option with tapping screws. Tightening torque should follow the specifications in the manual. If the screws are tightened outside of the specified torque range, poor connections may cause malfunctions.
 - Work carefully when using a screwdriver such as installation of the product. Failure to do so may cause damage to the product or accidents.
 - Connect the input/output cables and power cable securely to their designated connectors. Loose connections may cause malfunctions.
 - Turn off the power to the tension controller before attaching or detaching the optional devices. Failure to do so may cause equipment failures or malfunctions.
-

[WIRING PRECAUTIONS]

WARNING

- Make sure to cut off all phases of the power supply externally before attempting installation or wiring work. Failure to do so may cause electric shock or damage to the product.
 - Make sure to properly wire to the terminal block (Spring clamp type) in accordance with the following precautions. Failure to do so may cause electric shock, equipment failures, a short-circuit, wire breakage, malfunctions, or damage to the product.
 - The disposal size of the cable end should follow the dimensions described in the manual.
 - Twist the ends of stranded wires and make sure that there are no loose wires.
 - Do not solder-plate the electric wire ends.
 - Do not connect more than the specified number of wires or electric wires of unspecified size.
 - Affix the electric wires so that neither the terminal block nor the connected parts are directly stressed.
-

[WIRING PRECAUTIONS]

CAUTION

- Perform class D grounding (grounding resistance: 100 Ω or less) of the grounding terminal on the tension controller with a wire 0.2 to 1.5 mm². Do not use common grounding with heavy electrical systems.
 - Connect the power supply wiring to the dedicated terminals described in this manual. If an AC power supply is connected to a DC input/output terminal or DC power supply terminal, the tension controller will burn out.
 - Do not wire vacant terminals externally. Doing so may damage the product.
 - Install module so that excessive force will not be applied to terminal blocks, power wire, or communication cables. Failure to do so may result in wire damage/breakage or tension controller failure.
 - Make sure to observe the following precautions in order to prevent any damage to the machinery or accidents due to malfunction of the tension controller due to the effects of noise.
 - Do not bundle the power line and communication cables together with or lay them close to the main circuit, high-voltage line, load line or power line. As a guideline, lay the power line, control line and communication cables at least 100 mm away from the main circuit, high-voltage line, load line or power line.
 - Ground the shield of the shielded wire or shielded cable at one point on the tension controller. However, do not use common grounding with heavy electrical systems.
 - Ground the shield of the analog input/output cable at one point on the signal receiving side. However, do not use common grounding with heavy electrical systems.
-

[STARTUP AND MAINTENANCE PRECAUTIONS]

WARNING

- Do not touch any terminal while the tension controller's power is on. Doing so may cause electric shock or malfunctions.
 - Before cleaning, cut off all phases of the power supply externally. Failure to do so in the power ON status may cause electric shock.
-

[STARTUP AND MAINTENANCE PRECAUTIONS]

CAUTION

- Do not disassemble or modify the product. Doing so may cause fire, equipment failures, or malfunctions.
*For repair, contact your local Mitsubishi Electric representative.
 - Turn off the power to the tension controller before connecting or disconnecting any extension cable. Failure to do so may cause equipment failures or malfunctions.
 - Turn off the power to the tension controller before attaching or detaching the optional devices. Failure to do so may cause equipment failures, or malfunctions.
-

[DISPOSAL PRECAUTIONS]

CAUTION

- Please contact a certified electronic waste disposal company for the environmentally safe recycling and disposal of your device.
-

[TRANSPORTATION PRECAUTIONS]

CAUTION

- The tension controller is a precision instrument. During transportation, avoid impacts larger than those specified in the general specifications described in LE7-40GU APPLICATION MANUAL (SH-081822ENG) by using dedicated packaging boxes and shock-absorbing palettes. Failure to do so may cause failures in the tension controller. After transportation, verify operation of the tension controller and check for damage of the mounting part, etc.
 - When fumigants that contain halogen materials such as fluorine, chlorine, bromine, and iodine are used for disinfecting and protecting wooden packaging from insects, they cause malfunction when entering our products. Please take necessary precautions to ensure that remaining materials from fumigant do not enter our products, or treat packaging with methods other than fumigation (heat method). Additionally, disinfect and protect wood from insects before packing products.
-

INTRODUCTION

Thank you very much for purchasing the tension controller.

Before using, read this document, and thoroughly understand the functions and performance of the tension controller to use it correctly.

Regarding use of this product

- This product has been manufactured as a general-purpose part for general industries, and has not been designed or manufactured to be incorporated in a device or system used in purposes related to human life.
- Before using the product for special purposes such as nuclear power, electric power, aerospace, medicine or passenger movement vehicles, consult Mitsubishi Electric.
- This product has been manufactured under strict quality control. However when installing the product where major accidents or losses could occur if the product fails, install appropriate backup or failsafe functions in the system.

Note

- If in doubt at any stage during the installation of the product, always consult a professional electrical engineer who is qualified and trained in the local and national standards. If in doubt about the operation or use, please consult the nearest Mitsubishi Electric representative.
- Since the examples indicated by this manual, technical bulletin, catalog, etc. are used as a reference, please use it after confirming the function and safety of the equipment and system. Mitsubishi Electric will accept no responsibility for actual use of the product based on these illustrative examples.
- This manual content, specification etc. may be changed, without a notice, for improvement.
- The information in this manual has been carefully checked and is believed to be accurate; however, if you notice a doubtful point, an error, etc., please contact the nearest Mitsubishi Electric representative. When doing so, please provide the manual number given at the end of this manual.

TERMS

Unless otherwise specified, this manual uses the following terms.

Terms	Description
Option	Generic term for extension options, memory cassette
Extension options	Generic term for reel diameter calculation option, network option
Reel diameter calculation option	Generic term for the reel diameter calculation option LE7-DCA
Network option	Generic term for the network option LE7-CCL
LE7-40GU	Abbreviation for the tension controller LE7-40GU
LE7-DCA	Abbreviation for the reel diameter calculation option LE7-DCA
LE7-CCL	Abbreviation for the network option LE7-CCL
LD-8EEPROM	Abbreviation for LD-8EEPROM type EEPROM cassette

1 OUTLINE OF COMMUNICATION FUNCTION

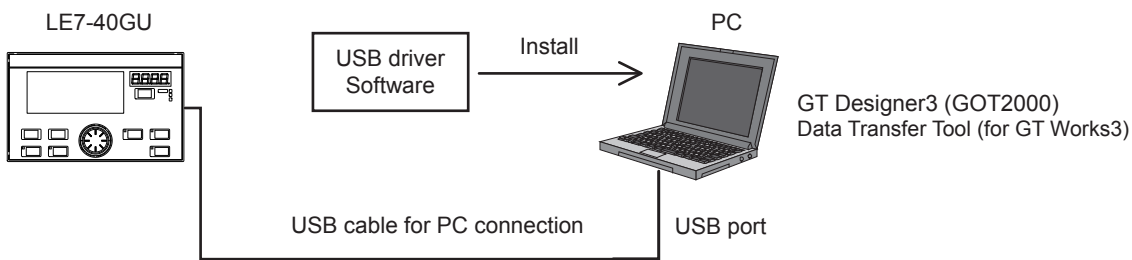

This chapter provides an outline of the communication function.

1.1 Communication with a Personal Computer (GT Designer 3 and Data Transfer Tool)

USB connection

LE7-40GU can be connected to a PC via USB.

Screen data can be written to LE7-40GU from GT Designer 3 (GOT2000) and Data Transfer Tool (for GT Works 3).

Ethernet connection

LE7-40GU can be connected to a PC via Ethernet (100BASE-TX, 10BASE-T).

Screen data can be written to LE7-40GU from GT Designer 3 (GOT2000) and Data Transfer Tool (for GT Works 3).

1.2 Ethernet Communication

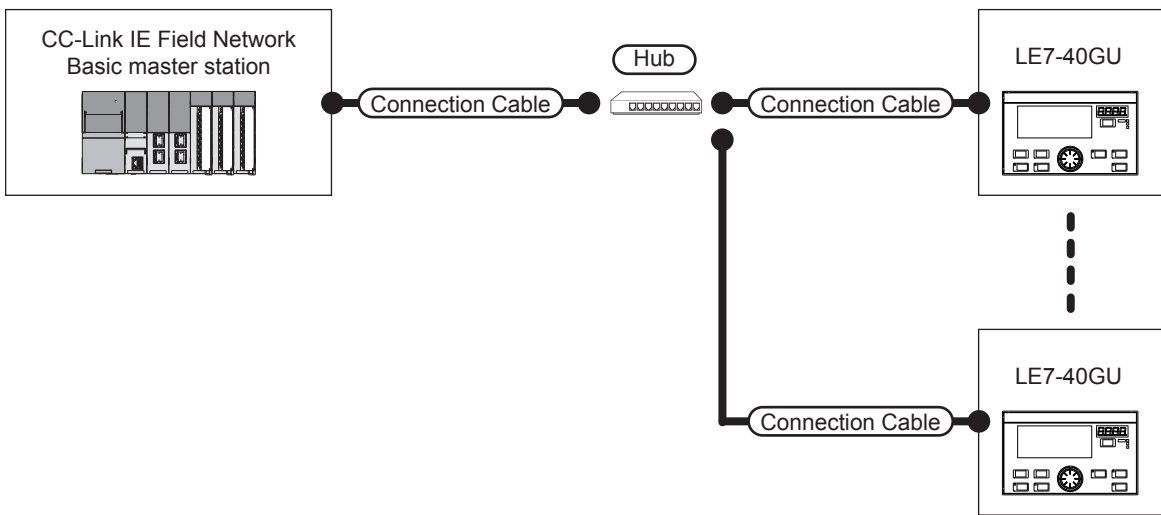

CC-Link IE Field Network Basic communication

LE7-40GU supports slave functionality for CC-Link IE field network basic communication.
LE7-40GU can communicate with all kinds of CC-Link IE field network basic communication master stations.

When connecting to one master station

When connecting one master station and multiple LE7-40GU (slave stations)

SLMP communication

LE7-40GU supports client functionality for SLMP communication.
LE7-40GU can communicate with various SLMP-compatible devices, and up to seven LE7-40GU units can be connected to one SLMP-compatible device to carry out data monitoring and parameter writing.

MODBUS/TCP (slave)

LE7-40GU can be operated as a slave station for MODBUS/TCP communication.
LE7-40GU (as a slave station) can perform data monitoring and parameter writing from up to four master stations.

1.3 RS-485 Communication

N:N Network

LE7-40GU can be operated as a local station for FX PLC N:N network communication.

Data monitoring and parameter writing from a master station FX PLC for up to seven local stations (LE7-40GU units) can be carried out.

MODBUS/RTU, ASCII (slave)

LE7-40GU can be operated as a slave station for MODBUS/RTU and ASCII communication.

Data monitoring and parameter writing from a master station for up to 247 slave stations (LE7-40GU units) can be carried out.

Precautions

RS-485 communication and CC-Link communication cannot be used simultaneously.

1.4 CC-Link Communication

LE7-40GU can be operated as a remote device station for CC-Link by connecting the optional LE7-CCL network option.

CCLink Ver. 1.10 and Ver. 2.00 are supported, so extended cyclic transmission can be performed.

For details on CC-Link Communication, refer to the following.

LE7-CCL APPLICATION MANUAL

Precautions

RS-485 communication and CC-Link communication cannot be used simultaneously.

2 COMMUNICATION WITH A PERSONAL COMPUTER (GT DESIGNER3, DATA TRANSFER TOOL)

Data is transferred between the personal computer (GT Designer3, Data Transfer Tool) and LE7-40GU.

For details on data transfer, refer to the following.

<GT Designer3 (GOT2000)>

📖 GT Designer3 (GOT2000) Screen Design Manual

<Data Transfer Tool (for GT Works3)>

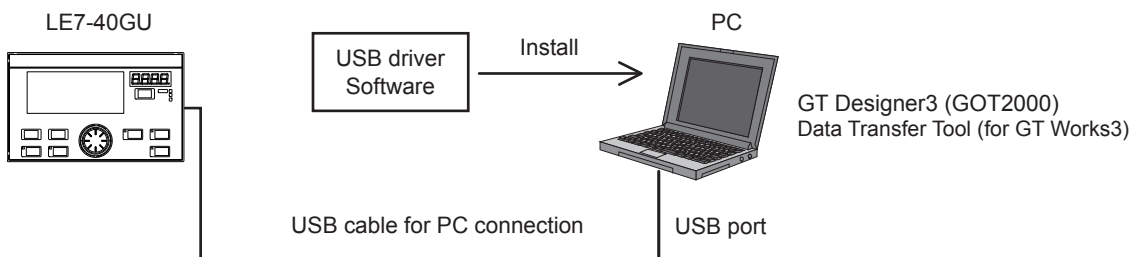

📖 Data Transfer Tool [GOT2000 Series] help

2.1 USB Connection

System configuration

Ensure that one of the following software packages is installed, and that the PC is equipped with a USB port.

- GT Designer3 (GOT2000)
- Data Transfer Tool (for GT Works3)^{*1}

*1 Obtain Data Transfer Tool (for GT Works3) from your local Mitsubishi Electric representative.

Communication specifications

Communication specifications of the USB communication are as follows.

Item	Specifications
Transmission standard	Compliant with USB 2.0 (full speed compatible)
Isolation method	Photocoupler isolation (between communication line and CPU)
Maximum transmission distance	Up to 5 m
Transmission speed	9600/19200/38400/57600/115200 bps
Connector type	USB (Mini-B plug female)
USB cable	<ul style="list-style-type: none"> • MR-J3USBCBL3M [3 m] • GT09-C30USB-5P [3 m] (manufactured by Mitsubishi Electric System & Service Co., Ltd.)

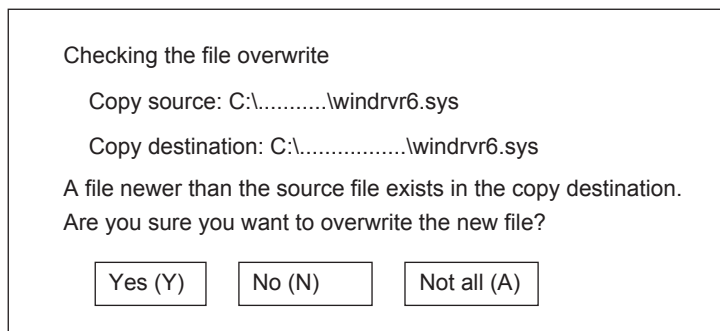

How to install the USB driver

Follow the procedure below.

1. Connect the A type connector of the USB cable to the USB port on the PC side.
2. Connect the Mini-B side of the USB cable to the USB interface of the LE7-40GU.
3. Switch on the LE7-40GU power supply.
4. The USB driver is installed automatically to the PC only when it is connected for the first time.

Point

When the USB driver of other products is installed, the confirmation message for overwriting the USB driver file (windrvr6.sys) may appear. If a new file already exists, click the [No] button and do not overwrite the file. When the file is overwritten, the USB communication of GT Designer3 and the LE7-40GU may not be properly executed.

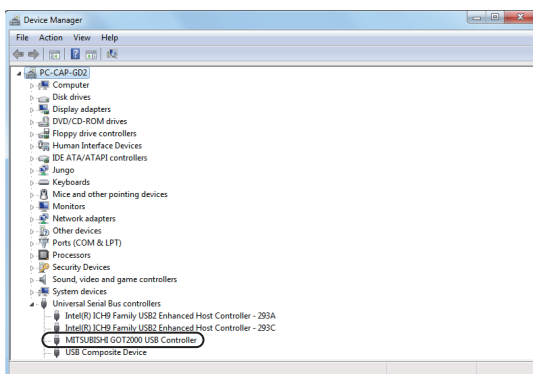

Precautions for using a USB cable

To transfer the data by connecting the personal computer and the LE7-40GU using a USB cable, do not set the resume function, the suspending function, the power saving function, or the standby mode of the personal computer. For the details of the resume function, the suspending function, the power saving function or the standby mode, refer to the manual of the personal computer or the Help of Windows.

If the USB cable is removed or the LE7-40GU is reset or powered off/on, the communication may not be recovered from an error. In this case, perform either of the following operations.

- Checking if the personal computer recognizes the USB.

Check that [MITSUBISHI GOT2000 USB Controller] is displayed in [USB (Universal Serial Bus) Controller] in the device manager.

- Restart the LE7-40GU.

Remove the USB cable from the LE7-40GU and power off the LE7-40GU. After the LE7-40GU is powered off, restart the LE7-40GU and connect a cable to communicate again.

2.2 Ethernet Connection

System configuration

Ensure that one of the following software packages is installed, and that the PC is equipped with an Ethernet port.

- GT Designer3 (GOT2000)
- Data Transfer Tool (for GT Works3)^{*1}

Direct connection

Connection via hub

^{*1} Obtain Data Transfer Tool (for GT Works3) from your local Mitsubishi Electric representative.

Communication specifications

The communication specifications of the Ethernet communication are as follows.

Item		Specification contents
Transmission specifications	Data transmission speed	100/10 Mbps
	Communication mode	Full duplex/half duplex ^{*1}
	Interface	RJ45 connector
	Transmission method	Baseband
	Maximum segment length (length between hub and node)	100 m
	Number of cascade connection stages	100BASE-TX
10BASE-T		Maximum 4 stages ^{*3}
Supported protocol		MELSOFT connection
Number of connections		MELSOFT connection (Up to 8 external devices can access one LE7-40GU simultaneously.)
Hub ^{*1}		Hubs with a 100BASE-TX or 10BASE-T ^{*4} port can be used.
IP address		Initial value: 192.168.3.250
Cable used ^{*2}	In the case of 100BASE-TX connection	Ethernet standard compatible item cable category 5 or more (STP cable)
	In the case of 10BASE-T connection	Ethernet standard compatible item cable category 3 or more (STP cable)

^{*1} IEEE802.3x flow control is not supported.

^{*2} Straight cable can be used.

^{*3} This is the number of connectable stages when using a repeater hub. Check the manufacturer of the switching hub to be used for the number of connectable stages when using a switching hub.

^{*4} The port must comply with the IEEE802.3 100BASE-TX or IEEE802.3 10BASE-T standard.

3 CC-LINK IE FIELD NETWORK BASIC COMMUNICATION

Since LE7-40GU supports the slave function of CC-Link IE Field Network Basic communication which is an open FA network, it can communicate with various CC-Link IE field network Basic master stations.

Precautions

- Since CC-Link IE Field Network Basic uses port No. [61451] as a device detection port, when port No. [61451] is used for another communication function, CC-Link IE Field Network Basic connection cannot be used.
- Since LE7-40GU handles a number of object functions besides the CC-Link IE Field Network Basic connection function, the response performance with respect to access from the master station may deteriorate. In such a case, it is necessary to adjust the link scan time or the timeout time on the master station side. The recommended setting value is 50 ms or more.

3.1 System Configuration

When connecting to one master station

Connection equipment	Communication form	Connection cable		Tension controller (slave station)		Number of connectable devices
		Cable type name*1	Maximum segment length	Optional equipment	Main unit	
CC-Link IE Field Network Basic master station	Ethernet	100BASE-TX Category 5 or more shield twisted pair cable (STP)	100 m	— (Built-in to main unit)	LE7-40GU	One LE7-40GU for one master station

*1 For twisted pair cable, please use a cross cable.

When connecting one master station and multiple LE7-40GU (slave stations)

- *1 Please use a hub that meets the following conditions.
- Complies with IEEE802.3 (100BASE-TX) standard
 - Automatic MDI/MDI-X function installed
 - Equipped with auto negotiation function
 - Switching hub (Layer 2 switch) (Repeater hub cannot be used.)

Connection equipment	Communication form	Connection cable		External device	Connection cable		Tension controller*3		Number of connectable devices
		Cable type name*4	Maximum segment length*3		Cable type Name*4	Maximum segment length*3	Optional equipment	Main unit	
CC-Link IE Field Network Basic master station	Ethernet*5	100BASE-TX Category 5 or more shield twisted pair cable (STP)	100 m	Hub*2	100BASE-TX Category 5 or more shield twisted pair cable (STP)	100 m	— (Built-in to main unit)	LE7-40GU	Maximum 64 units of LE7-40GU (slave station) for one master station

*2 Connect CC-Link IE Field Network Basic master station via a hub. Use cables, connectors and hubs that satisfy the IEEE802.3 100BASE-TX standard.

*3 This is the length between the hub and the node. The maximum distance depends on the Ethernet device used. When using a repeater hub, the number of units that can be connected is as follows.

- 100 BASE-TX: Cascade connection maximum 2 (205 m)

When using a switching hub, the cascade connection between switching hubs has no theoretical limit on the number that can be cascaded.

*4 For the twisted pair cable, please use a straight cable.

*5 CC-Link IE Field Network Basic communication does not support connection beyond the router.

3.2 Communication Setting

Communication parameter settings

When using CC-Link IE Field Network Basic communication, set the communication parameters with the following procedure.

Setting with Data Transfer Tool

1. Obtain the "Screen package data for CC-Link IEF Basic" from your local Mitsubishi Electric representative.
 2. Transfer the "Screen package data for CC-Link IEF Basic" to LE7-40GU with Data Transfer Tool (for GT Works3).
- For more information on data transfer, refer to the following.

☞ Page 14 COMMUNICATION WITH A PERSONAL COMPUTER (GT DESIGNER3, DATA TRANSFER TOOL)

3. Select "CC-Link IEF Basic" on the "Ethernet communication selection" screen of the LE7-40GU screen.

4. If you want to change the IP address of LE7-40GU (default: 192.168.3.18), change it on the "IP address setting" screen of LE7-40GU.

5. Restart LE7-40GU.

Setting with GT Designer3 (GOT2000)

1. Obtain the "Screen package data for CC-Link IEF Basic" from your local Mitsubishi Electric representative.
2. Open the "Screen package data for CC-Link IEF Basic" in GT Designer3 (GOT2000) and change the settings of [Common] - [Controller Settings] - [CH2] as follows.

For details on the communication settings in GT Designer3 (GOT2000), refer to the following.

 GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals)

<Controller Setting>

Setting name	Setting detail
Manufacturer	CLPA
Controller Type	CC-Link IE Field Network Basic
I/F	Ethernet:Multi
Driver	Ethernet(CC-Link IE Field Network Basic)

<Detail setting>

Property	Value
GOT Net No.	0 (Not used)
GOT Station	0 (Not used)
GOT Communication Port No.	61450 (Fixed)

3. Change the settings of [Common] - [GOT Ethernet Setting] - [GOT IP Address Setting] as follows.

For details on the communication settings in GT Designer3 (GOT2000), refer to the following.

 GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals)

<GOT IP Address Setting>

Setting name	Setting value
GOT IP Address	192.168.3.18 (optional)

4. Transfer the "Screen package data for CC-Link IEF Basic" to LE7-40GU with GT Designer3 (GOT2000)

For more information on data transfer, refer to the following.

 Page 14 COMMUNICATION WITH A PERSONAL COMPUTER (GT DESIGNER3, DATA TRANSFER TOOL)

5. Select "CC-Link IEF Basic" on the "Ethernet communication selection" screen of the LE7-40GU screen.

6. Restart LE7-40GU.

Link data configuration

LE7-40GU uses "1" for the number of occupied stations because the contents of the allocated link data does not change even if the number of occupied stations of the CC-Link IE Field Network Basic slave station is changed.

*1 When using other than "1" for the number of occupied stations, all functions except remote input/output and remote register become non-functioning.

Remote input/output

Each remote input/output has 48 points.

The remaining area becomes non-functioning and cannot be used.

- Remote output (Master Station → Slave Station)

Remote register

Remote register uses 12 points for both RWw and RWr.

The remaining area becomes non-functioning and cannot be used.

Continuous setting/continuous monitoring

Data specified in advance can be set and monitored continuously by setting the continuous setting execution (RY2E) and continuous monitor execution (RY2E) in the master station to ON.

For continuous setting data, the data set for RAM writing is not stored during a power failure.

The latest data existing in LE7-40GU when the master station gives the send request can be monitored continuously.

However, regarding the update of parameters for which the monitor update cycle is specified by the setting in LE7-40GU, the data is updated in the specified update cycle if the specified update cycle is longer than the monitor update cycle in the send request given by the master station.

Continuous settings

1. Data write to devices with continuous settings 1 to 16
2. Turn on continuous settings execution

Continuous monitor

1. Turn on continuous monitor execution
2. Read the data of the devices of continuous monitors 1 to 16

Access by request command

For any access to data in LE7-40GU from the master station, data can be read and written by handshake between the "request command execution (RY2F)" flag and the "request command completion (RX2F)" flag.

This access is performed using a 2-word word device of the master station.

This 2-word data is comprised of the request command, to which the upper 4 bits of the first word are assigned, and the request code, to which the lower 2 bits are assigned, and the setting data, to which the next word is assigned.

bit 15 to 12	bit 11 to 0
Request command	Request code
Setting data	

There are three types of request command, Data Monitor, Writing to RAM, and Writing to RAM + ROM, according to the selection of data reading and writing method.

Monitor	Writing to RAM	Writing to RAM + ROM
Writing data is reflected in the settings based on a data read request from the master station but is not stored in the case of a power failure.	Writing data is reflected in the settings based on a data write request from the master station but is not stored in the case of a power failure.	Perform the above RAM write + data power failure write.

In the ROM for storage against power interruption, the allowable number of times of writing is limited. Accordingly, data cyclically written and updated by the PLC must be written only to the RAM.

Request command	Contents of execution	Execution result
H0	Monitor	Monitored value
H1	Writing to RAM	Writing result
H2	Writing to RAM + ROM	Writing result

The request code is the data number (address) of the data that executes the request command. The subsequent data setting is the data to be written to the data number, and if the request command is the monitor, the data setting data is ignored.

When double word data is written to send data in the master station, and the handshake is executed by turning ON/OFF the request command execution flag and request command completion flag as follows, LE-70GU sends back the request command execution request.

1. The master station is set to request command execution ON.
2. LE7-40GU executes processing when receiving turning ON of the request command execution by the master station.
3. LE7-40GU turns ON the request command completion.
4. The master station receives the request command completion ON.
5. The master station is set to request command execution OFF.

6. LE7-40GU receives turning OFF of the request command execution by the master station.
7. LE7-40GU turns OFF the request command completion.
8. The master station receives the request command completion OFF.

Please perform reading of the execution results of the request command between step 4 and 5 of the handshake procedure. If an error occurs, in the execution result with respect to the request command from the master station, turn on the network alarm occurrence flag and output the device number where the alarm occurred to the network alarm device number monitor. For the request command execution result, refer to the following.

 LE7-CCL APPLICATION MANUAL

Request code

The numerical value of each parameter corresponding to the request code is treated as real number data without a decimal point.

In addition, the minimum and maximum values are determined for LE7-40GU, and when a value exceeding this data is written, it is automatically rewritten to the minimum or maximum value.

In this case, an "Out of data range" alarm is generated.

Request code	Name	Monitor/ settings	Extension option	Minimum value	Maximum value	Unit

Explanation

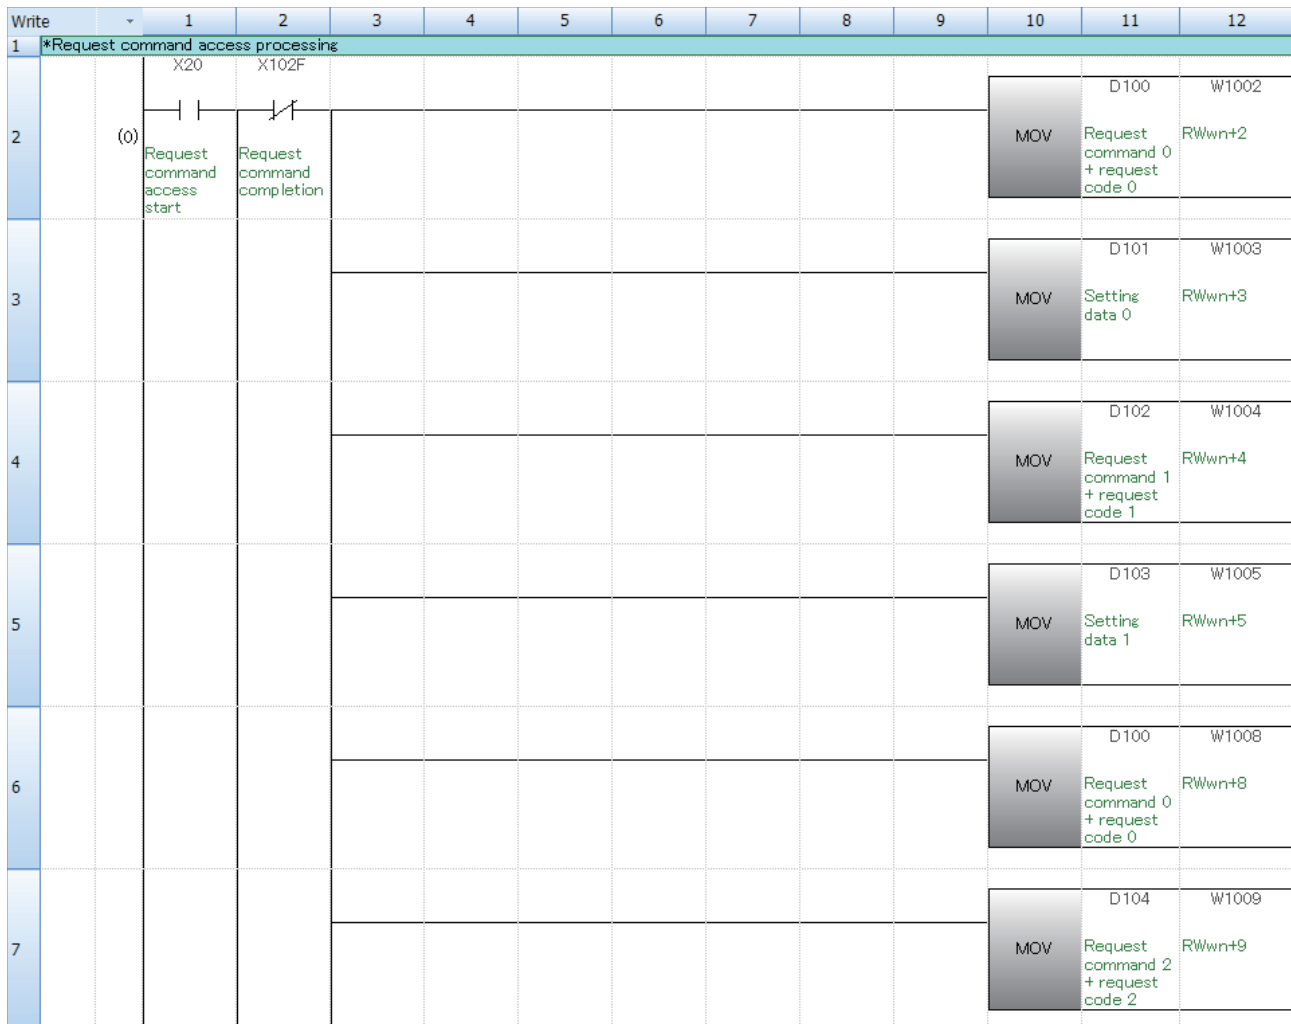

Display the link device (RX/RX/RW/RWw) to be refreshed.

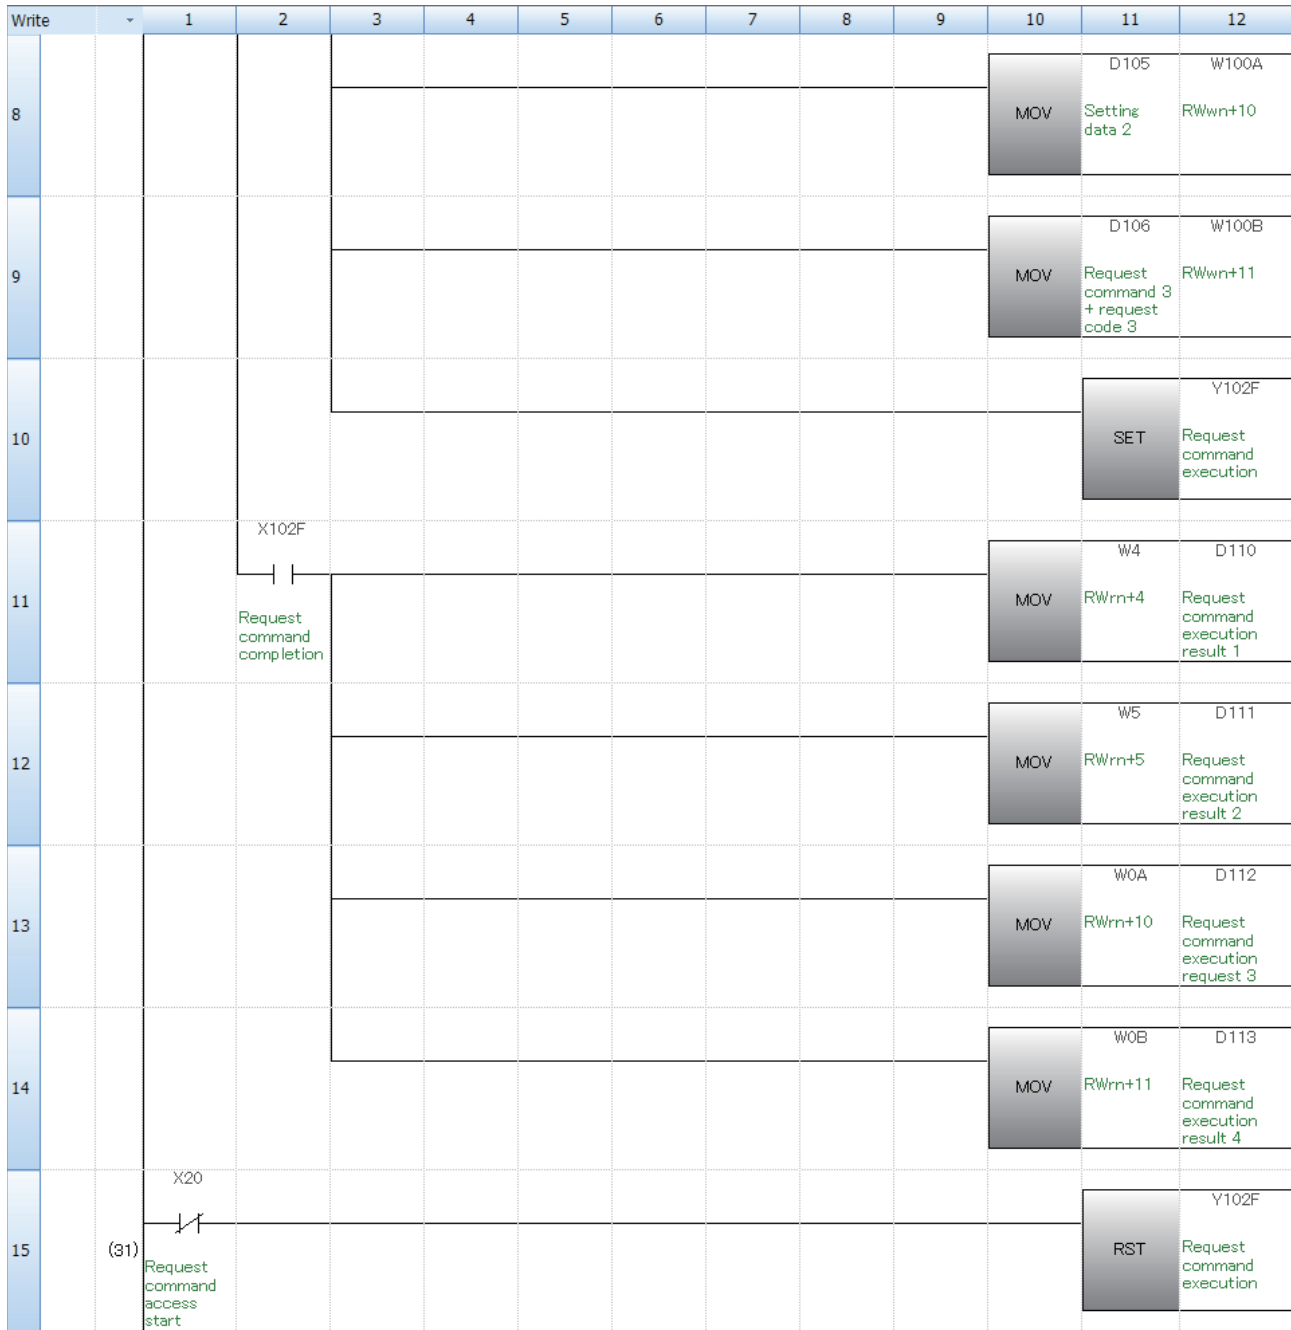

Check Restore the Default Settings Apply

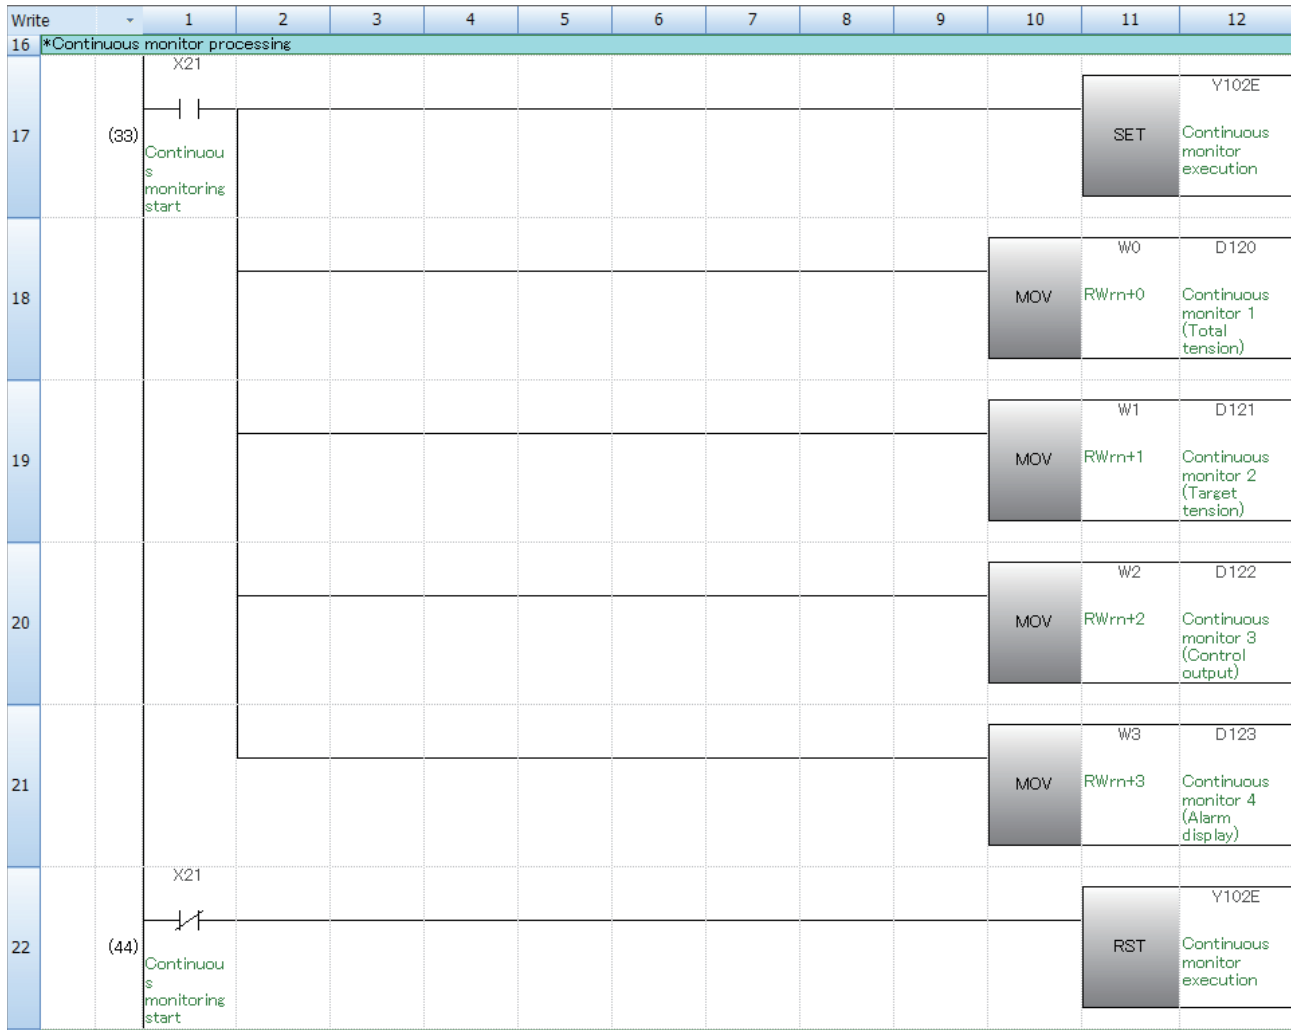

External device configuration

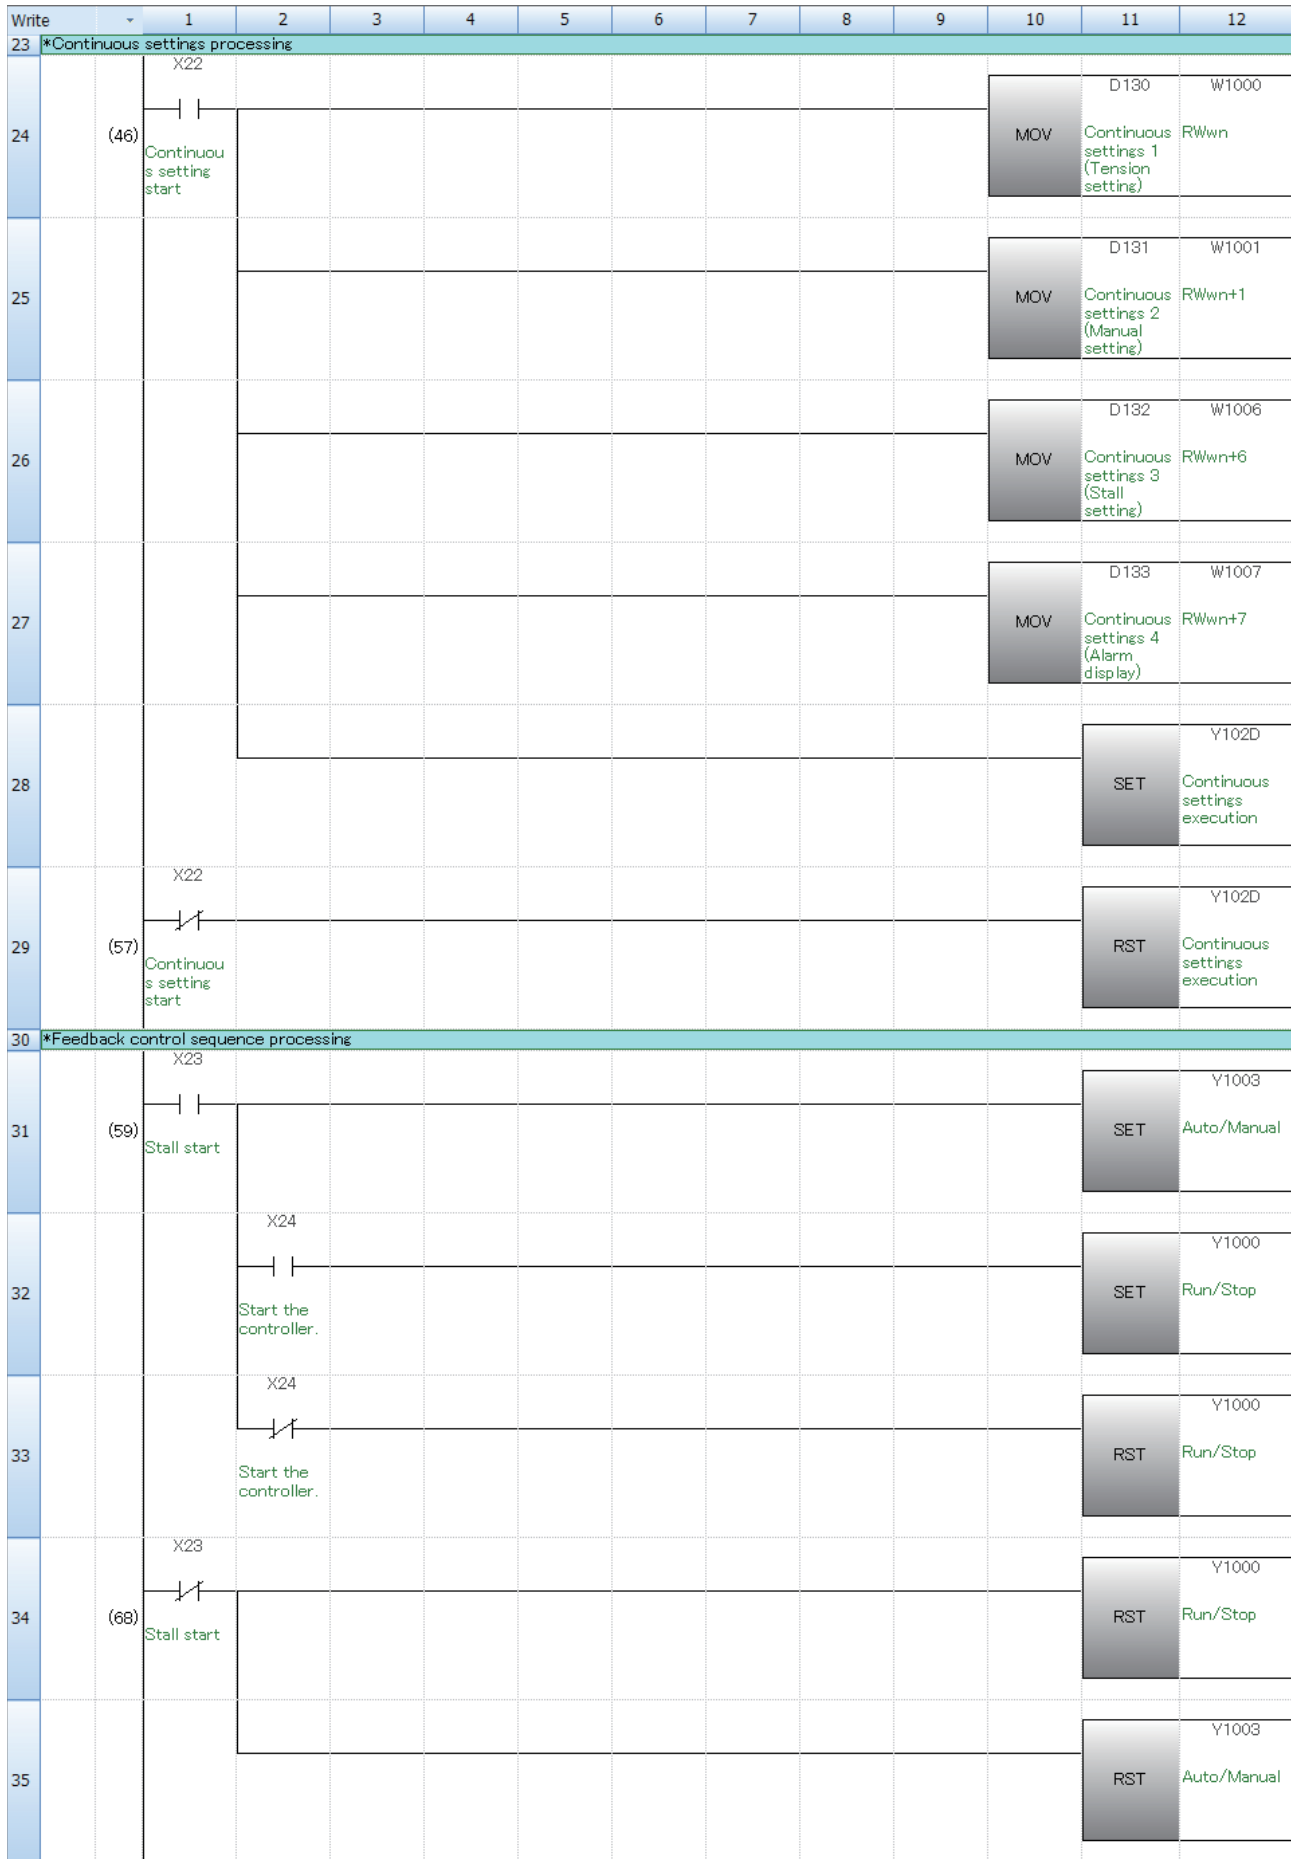

Setting is unnecessary.

Program example

Write		1	2	3	4	5	6	7	8	9	10	11	12
36	*Status monitoring processing												
37	(71)	X1000 Run/Stop											Y30 Running lamp
38	(74)	X1008 Manual control											Y31 Manual control lamp
39	(76)	X1009 Automatic control											Y32 Automatic control lamp
40	(78)	X100A Auto lamp flicker in operation/ stopped											Y33 Auto lamp flicker in operation lamp
41	(80)	X102F Request command completion											Y34 Request command completion lamp
42	(82)	X102E Continuous monitor being executed											Y35 Continuous monitor being executed lamp
43	(84)	X102D Continuous settings being executed											Y36 Continuous settings being executed lamp
44	(86)												[END]

Using method of ladder

Required data is stored to D100 to D133, and each function is executed in X20 to X24.

List of used devices (The allocation is an example.)

Device name	Classification ^{*1}	Allocation function	Use
D100 to D106	Setting	Request command + request code/data setting 1 to 4	Device set to use the request command
D110 to D113	Setting	Request command execution result 1 to 4	Request command execution result is stored.
D120 to D123	Setting	Continuous monitor 1 to 4	Continuous monitor execution result is stored.
D130 to D133	Setting	Continuous setting 1 to 4	Setting value of continuous setting is stored.
X20	Setting	Start request command access execution	Execute request command.
X21	Setting	Start continuous monitor execution	Start to execute continuous monitor.
X22	Setting	Start continuous setting execution	Start to execute continuous setting.
X23	Setting	Start stall execution	Start to execute stall.
X24	Monitoring	Start operation	Start to operate.
Y30	Monitoring	Run	Run: ON/Stop: OFF
Y31	Monitoring	Manual control	Manual control ON
Y32	Monitoring	Automatic control	Automatic control ON
Y33	Monitoring	Auto lamp flicker in operation	Auto lamp flicker in operation ON
Y34	Monitoring	Request command completion	ON when request command is completed
Y35	Monitoring	Continuous monitor being executed	ON when continuous monitor is being executed.
Y36	Monitoring	Continuous settings being executed	ON when continuous setting is being executed.

*1 Classification

Setting: items to be set/input when using functions

Monitoring: items to monitor output when using functions

4 SLMP COMMUNICATION

Since the LE7-40GU supports the SLMP communication function which is an open FA network, it can communicate with various SLMP-compatible devices. Also, up to seven LE7-40GU units can be connected to one SLMP-compatible device to carry out data monitoring and parameter writing.

Precautions

If you replace an external device or an SLMP equipment due to a malfunction, the MAC address of the connected device changes, so communication may not be possible. (When exchanged with the same IP address equipment)

If you replace a device in the Ethernet, restart all the devices in the network.

4.1 System Configuration

Connection equipment	Communication form	Connection cable		External device	Connection cable		Tension controller ^{*2}		Number of connectable devices
		Cable type name ^{*4}	Maximum segment length ^{*3}		Cable type name ^{*4}	Maximum segment length ^{*3}	Optional equipment	Main unit	
SLMP equipment	Ethernet	<ul style="list-style-type: none"> • 1000BASE-T 100BASE-TX Category 5 or more of shield twisted pair cable (STP) or unshielded twisted pair cable (UTP) • 10BASE-T Category 3 or more of shield twisted pair cable (STP) or unshielded twisted pair cable (UTP) 	100 m	Hub ^{*1}	<ul style="list-style-type: none"> • 1000BASE-T 100BASE-TX Category 5 or more of shield twisted pair cable (STP) or unshielded twisted pair cable (UTP) • 10BASE-T Category 3 or more of shield twisted pair cable (STP) or unshielded twisted pair cable (UTP) 	100 m	— (Built-in to main unit)	LE7-40GU	Up to seven units can be connected to one SLMP compatible device The maximum number of connected units may be seven or less depending on the SLMP equipment used ^{*5}

*1 Please connect with SLMP equipment via a hub.

Use cables, connectors, and hubs that satisfy the IEEE 802.3 10BASE-T/100BASE-TX/1000BASE-T standard.

*2 When connecting LE7-40GU to 10 BASE (- T/2/5) compliant equipment, use it in a network environment where 10 Mbps/100 Mbps can be mixed using a switching hub.

*3 This is the length between the hub and the node.

The maximum distance depends on the Ethernet device used.

When using a repeater hub, the number of units that can be connected is as follows.

- 10BASE-T: Cascade connection up to 4 units (500 m)
- 100BASE-TX: Cascade connection up to 2 units (205 m)

When using a switching hub, the cascade connection between switching hubs has no theoretical limit on the number that can be cascaded.

Please check with the manufacturer of the switching hub used for any restrictions.

*4 For the twisted pair cable, please use a straight cable.

*5 For details, refer to the manual of the SLMP equipment used.

4.2 Communication Setting

Communication parameter settings

When using SLMP communication, set the communication parameters with the following procedure.

Setting with Data Transfer Tool

1. Obtain the "Screen package data for SLMP communication" from your local Mitsubishi Electric representative.
2. Transfer the "Screen package data for SLMP communication" to LE7-40GU with Data Transfer Tool (for GT Works3).
For more information on data transfer, refer to the following.

☞ Page 14 COMMUNICATION WITH A PERSONAL COMPUTER (GT DESIGNER3, DATA TRANSFER TOOL)

3. Select "SLMP" on the "Ethernet communication selection" screen of the LE7-40GU screen.

4. If you want to change the IP address of LE7-40GU (default: 192.168.3.18), change it on the "IP address setting" screen of the LE7-40GU screen.

5. If you want to change the SLMP station No. (default: 2), change it on the "SLMP station number" screen on the LE7-40GU screen.

6. Restart LE7-40GU.

Precautions

For SLMP communication, only the LE7-40GU station No. and IP address can be changed on the LE7-40GU screen. To change the port number or SLMP equipment communication settings, they must be set with GT Designer3 (GOT2000).

Setting with GT Designer3 (GOT2000)

1. Obtain the "Screen package data for SLMP communication" from your local Mitsubishi Electric representative.
2. Open the "Screen package data for SLMP communication" in GT Designer3 (GOT2000) and change the settings of [Common] - [Controller Setting] - [CH2] as follows.

For details on the communication settings in GT Designer3 (GOT2000), refer to the following.

 GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals)

<Controller Setting>

<Ethernet Controller Setting>

Setting name	Setting value
Net No.	1
Station	1
Unit tType	SLMP
IP Address	192.168.3.250
Port No.	49152
Communication	UDP

3. Transfer the "Screen package data for SLMP communication" to LE7-40GU with GT Designer3 (GOT2000).

For more information on data transfer, refer to the following.

 Page 14 COMMUNICATION WITH A PERSONAL COMPUTER (GT DESIGNER3, DATA TRANSFER TOOL)

4. Select "SLMP" on the "Ethernet communication selection" screen of the LE7-40GU screen.

5. Restart LE7-40GU.

Link data configuration

Link data of SLMP server equipment and LE7-40GU uses D100 to D179 of SLMP equipment D device.

SLMP server equipment→LE7-40GU		
Device No. (server equipment)	Signal name	
D100	Station No. command	
D101	Input signal 0 to 15	
D102	Input signal 16 to 31	
D103	Input signal 32 to 47	
D104	Continuous settings 1	
D105	Continuous settings 2	
D106	Request command 0	Request code 0
D107	Setting data 0	
D108	Request command 1	Request code 1
D109	Setting data 1	

LE7-40GU→SLMP server equipment	
Device No. (server equipment)	Signal name
Dn	—
Dn+1	Output signal 0 to 15
Dn+2	Output signal 16 to 31
Dn+3	Output signal 32 to 47
Dn+4	Continuous monitor 1
Dn+5	Continuous monitor 2
Dn+6	Continuous monitor 3
Dn+7	Setting monitor 4
Dn+8	Request command 0 execution result
Dn+9	Settings command 1 execution result

*1 Dn switches according to the LE7-40GU SLMP station No. setting. (Station No. 1: D 110, Station No. 2: D 120 ... Station No. 7: D 170)

Station Number command

Determine the station No. of the LE7-40GU to be accessed by the station No. command of the SLMP equipment D device (D 106).

By setting the station No. command to 0, simultaneous settings can be done for all LE7-40GU units.

Station No. command	Function
1 to 7	Individual access to designated LE7-40GU
0	Simultaneous access to all LE7-40GU units

Continuous setting/continuous monitoring

By simply turning on continuous settings execution (D103, b13) and continuous monitor execution (D103, b14) of SLMP equipment, preset data can be set and monitored continuously.

For continuous setting data, the data set for RAM writing is not stored during a power failure.

The latest data existing in LE7-40GU when the master station gives the send request can be monitored continuously.

However, regarding the update of parameters for which the monitor update cycle is specified by the setting in LE7-40GU, the data is updated in the specified update cycle if the specified update cycle is longer than the monitor update cycle in the send request given by the master station.

Access by request command

For any access to data in LE7-40GU from the SLMP equipment, data can be read and written by handshake between the "request command execution" flag and the "request command completion" flag.

Double word data from the SLMP equipment is used for this access.

This 2-word data is comprised of the request command, to which the upper 4 bits of the first word are assigned, and the request code, to which the lower 2 bits are assigned, and the setting data, to which the next word is assigned.

bit 15 to 12	bit 11 to 0
Request command	Request code
Setting data	

There are three types of request command, Data Monitor, Writing to RAM, and Writing to RAM + ROM, according to the selection of data reading and writing method.

Monitor	Writing to RAM	Writing to RAM + ROM
Writing data is reflected in the settings based on a data read request from the SLMP equipment but is not stored against power interruption.	Writing data is reflected in the settings based on a data write request from the SLMP equipment but is not stored against power interruption.	Execute data writing to the RAM + ROM (for storage against power interruption).

Since there is a limit on the number of writable times in the ROM for power failure storage, it is necessary to write the data where write updates are performed periodically from the PLC only to RAM.

Request command	Contents of execution	Execution result
H0	Monitor	Monitored value
H1	Writing to RAM	Writing result
H2	Writing to RAM + ROM	Writing result

The request code indicates the data No. (address) of data for which the request command is executed. Also, the subsequent data setting is the data to be written to that data number.

If the request command is a monitor, the data setting data is ignored.

When double word data is written to send data in the SLMP equipment, and the handshake is executed by turning ON/OFF the request command execution flag and request command completion flag as follows, LE7-40GU sends back the request command execution result.

If an error occurs, triggered by the request command from the SLMP equipment, the local station turns ON the network alarm occurrence flag and outputs the device No. that has the error to the monitor of the device number of the network alarm.

1. SLMP compatible device executes request command (D103, b15) ON.
2. The LE7-40GU processes in accordance with the SLMP equipment request command execution ON.
3. LE7-40GU turns ON the request command completion.
4. The SLMP equipment receives request command completion (Dn+3, b15) ON.
5. The SLMP equipment sets request command completion OFF.
6. The LE7-40GU receives request command execution OFF from the SLMP equipment.
7. LE7-40GU turns OFF the request command completion.
8. The SLMP equipment receives turning OFF of the request command completion.

Please perform reading of the execution results of the request command between step 4 and 5 of the handshake procedure.

For the request command execution result, refer to the following.

 LE7-CCL APPLICATION MANUAL

Request code

The numerical value of each parameter corresponding to the request code is treated as real number data without a decimal point.

In addition, the minimum and maximum values are determined for LE7-40GU, and when a value exceeding this data is written, it is automatically rewritten to the minimum or maximum value.

In this case, an "Out of data range" alarm is generated.

Request code	Name	Monitor/ settings	Extension option	Minimum value	Maximum value	Unit

4.3 Reference Program

A basic example program (GX Works3) for SLMP communication is described.

System configuration

Parameter settings

Own node settings

Item	
Own Node Settings	
Parameter Setting Method	Parameter Editor
IP Address	
IP Address	192 . 168 . 3 . 250
Subnet Mask
Default Gateway
Enable/Disable Online Change	Enable All (SLMP)
Communication Data Code	Binary
Opening Method	Do Not Open by Program
CC-Link IEF Basic Setting	
To Use or Not to Use CC-Link IEF Basic Setting	Disable
Network Configuration Settings	<Detailed Setting>
Refresh Settings	<Detailed Setting>
External Device Configuration	
External Device Configuration	<Detailed Setting>

CC-Link IEF Basic setting

To use or not use CC-Link IEF Basic setting: Disable

External device configuration

No.	Model Name	Communication Method	Protocol	Fixed Buffer Send/Receive Setting	PLC		Sensor/Device						
					IP Address	Port No.	MAC Address	Host Name	IP Address	Port No.	Subnet Mask	Default Gateway	
	Host Station				192.168.3.250								
1	SLMP Connection Module	SLMP	UDP		192.168.3.250	49152							
2	SLMP Connection Module	SLMP	UDP		192.168.3.250	49153							

The diagram shows a Host Station (labeled '自局 Connected Count 12') connected to two SLMP Connection Modules. The connections are labeled 'Connection No.1' and 'Connection No.2'. Below the diagram, the modules are identified as 'SLMP Connection Module'.

Program example

Write	1	2	3	4	5	6	7	8	9	10	11	12	
1	Station No. command switching sequence (This program assumes alternate communication between station No. 2 and station No. 3.)												
2	Start from sequence No. 0												
3	(0)									MOV	K0	D20 Sequence No.	
4	Advance sequence by 1 when response to station No. command is received (0 to 3)

41											SET	D103D Continuous settings execution
42			X22Z1 /								RST	D103D Continuous settings execution

Ladder Operation

Operation is changed depending on the sequence No. When the PLC is started, the sequence No. 1 is set, and the station No. command is changed as the following table (station No. 1). When the station No. response (station No. 2) and the station No. response (station No. 3) match with the station No. command, the sequence No. increases by one. When the process up to sequence No. 3 is complete, the number returns to 0.

Sequence No. (D20)	Station No. command (D100)	Station No. offset (D10)	Station No. command being changed (M100)	Available		Description
				Setting	Monitoring	
0	1	2	OFF	○	○	Change the setting value of station No. 2.
1	2	2	ON	×	○	Change the station No. command to 2. Setting value is reflected.
2	1	3	OFF	○	○	Change the setting value of station No. 3.
3	3	3	ON	×	○	Change the station No. command to 3. Setting value is reflected.

Using method of ladder

List of used devices (The allocation is an example.)

Device name		Classification ^{*1}	Allocation function	Use
Station No. 2	Station No. 3			
D200 to D203	D210 to D213	Setting	Request command + request code/data setting 1 to 2	Device set to use the request command
D204 to D205	D214 to D215	Setting	Request command execution result 1 to 2	Request command execution result is stored.
D300 to D303	D310 to D313	Setting	Continuous monitor 1 to 4	Continuous monitor execution result is stored.
D400 to D401	D410 to D413	Setting	Continuous setting 1 to 2	Setting value of continuous setting is stored.
X20	X30	Setting	Start request command access execution	Execute request command.
X21	X31	Setting	Start continuous monitor execution	Start to execute continuous monitor.
X22	X32	Setting	Start continuous setting execution	Start to execute continuous setting.
X23	X33	Setting	Start stall execution	Start to execute stall.
X24	X34	Monitoring	Start operation	Start to operate.
Y30	Y40	Monitoring	Run	Run: ON/Stop: OFF
Y31	Y41	Monitoring	Manual control	Manual control ON
Y32	Y42	Monitoring	Automatic control	Automatic control ON
Y33	Y43	Monitoring	Auto lamp flicker in operation	Auto lamp flicker in operation ON
Y34	Y44	Monitoring	Request command completion	ON when request command is completed
Y35	Y45	Monitoring	Continuous monitor being executed	ON when continuous monitor is being executed.
Y36	Y46	Monitoring	Continuous settings being executed	ON when continuous setting is being executed.
D100 to D109		System	Link data (Station No. 1)	Setting items such as input signal are stored.
D110 to D119		System	Link data (Station No. 2)	Monitored item from station No. 2 is stored.
D120 to D129		System	Link data (Station No. 3)	Monitored item from station No. 3 is stored.
D20		System	Sequence No.	Processing is changed by the sequence No.
M100		System	Station No. command being changed	Turn ON when the station No. command is being written.
D10		System	Station No. command storage device	Offset the device according to the station No.
D11		System	Station No. offset	Used to offset the device

*1 Classification

Setting: items to be set/input when using functions

Monitoring: items to monitor output when using functions

System: Used for internal processing, setting is unnecessary

5 MODBUS/TCP (SLAVE)

Since LE7-40GU supports the slave function of MODBUS/TCP communication which is an open FA network, it can communicate with various MODBUS/TCP master equipment. Also, LE7-40GU (as a slave station) can perform data monitoring and parameter writing from up to four master stations.

5.1 System Configuration

Connection equipment	Communication form	Connection cable		External device	Connection cable		Tension controller ^{*2}		Number of connectable devices
		Cable type name ^{*4}	Maximum segment length ^{*3}		Cable type name ^{*4}	Maximum segment length ^{*3}	Optional equipment	Main unit	
MODBUS/TCP master device	Ethernet	<ul style="list-style-type: none"> • 100BASE-TX Category 5 or more of shield twisted pair cable (STP) or unshielded twisted pair cable (UTP) • 10BASE-T Category 3 or more of shield twisted pair cable (STP) or unshielded twisted pair cable (UTP) 	100 m	Hub ^{*1}	<ul style="list-style-type: none"> • 100BASE-TX Category 5 or more of shield twisted pair cable (STP) or unshielded twisted pair cable (UTP) • 10BASE-T Category 3 or more of shield twisted pair cable (STP) or unshielded twisted pair cable (UTP) 	100 m	— (Built-in to main unit)	LE7-40GU	Master equipment: When LE7-40GU is N:1, four or less master equipment for one LE7-40GU) Master equipment: When LE7-40GU is 1:N, the following number of LE7-40GU units for one master device. Depending on the MODBUS/TCP master equipment used ^{*5}

*1 Connect with MODBUS/TCP master equipment via a hub.

Use cables, connectors, and hubs that satisfy the IEEE 802.3 10BASE-T/100BASE-TX/1000BASE-T standard.

*2 When connecting LE7-40GU to 10BASE (-T/2/5) compliant equipment, please use it in a network environment where 10 Mbps/100 Mbps can be mixed using a switching hub.

*3 This is the length between the hub and the node.

The maximum distance depends on the Ethernet device used.

When using a repeater hub, the number of units that can be connected is as follows.

- 10BASE-T: Cascade connection up to 4 units (500 m)
- 100BASE-TX: Cascade connection up to 2 units (205 m)

When using a switching hub, the cascade connection between switching hubs has no theoretical limit on the number that can be cascaded.

Please check with the manufacturer of the switching hub used for any restrictions.

*4 For the twisted pair cable, please use a straight cable.

*5 For details, refer to the manual of the MODBUS/TCP master equipment used.

5.2 Communication Setting

Communication parameter settings

When using MODBUS/TCP communication (slave), set the communication parameters with the following procedure.

Setting with Data Transfer Tool

1. Obtain the "Screen package data for MODBUS/TCP" from your local Mitsubishi Electric representative.
2. Transfer the "Screen package data for MODBUS/TCP" to LE7-40GU with Data Transfer Tool (for GT Works3).
For more information on data transfer, refer to the following.

☞ Page 14 COMMUNICATION WITH A PERSONAL COMPUTER (GT DESIGNER3, DATA TRANSFER TOOL)

3. Select "MODBUS/TCP" on the "Ethernet communication selection" screen of the LE7-40GU screen.

4. If you want to change the IP address of LE7-40GU (default: 192.168.3.18), change it on the "IP address setting" screen of the LE7-40GU screen.

5. Restart LE7-40GU.

Precautions

For MODBUS/TCP communication, only the IP address can be changed on the LE7-40GU screen.
To change the port number, it must be set in GT Designer3 (GOT2000).

Setting with GT Designer3 (GOT2000)

1. Obtain the "Screen package data for MODBUS/TCP" from your local Mitsubishi Electric representative.
2. Open the "Screen package data for MODBUS/TCP" in GT Designer3 (GOT2000) and change the settings of [Common] - [Controller Settings] - [CH2] as follows.

For details on the communication settings in GT Designer3 (GOT2000), refer to the following.

GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals)

<Controller Setting>

Setting name	Setting detail
Manufacturer	MODBUS
Controller Type	MODBUS Slave
I/F	Ethernet:Multi
Driver	MODBUS/TCP Slave, Gateway

<Detail setting>

Property	Value
GOT Net No.	0 (Fixed)
GOT Station	255 (Fixed)
GOT Communication Port No.	502 (Optional)
Delay Time(ms)	0
32bit Storage	LH Order

3. Change the settings of [Common] - [GOT Ethernet Setting] - [GOT IP Address Setting] as follows.

For details on the communication settings in GT Designer3 (GOT2000), refer to the following.

GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals)

<GOT IP Address Setting>

Setting name	Setting value
GOT IP Address	192.168.3.18 (optional)

4. Transfer the "Screen package data for MODBUS/TCP" to LE7-40GU with GT Designer3 (GOT2000).

For more information on data transfer, refer to the following.

Page 14 COMMUNICATION WITH A PERSONAL COMPUTER (GT DESIGNER3, DATA TRANSFER TOOL)

5. Select "MODBUS/TCP" on the "Ethernet communication selection" screen of the LE7-40GU screen.

6. Restart LE7-40GU.

Bit device

The input relay (1) and the coil (0) each have 48 points. The remaining area becomes non-functioning and cannot be used.

400011	Request command 3	Request code 3	
400012	Setting data 3		
400013 to 16	Unavailable		

- Input register (3) (Slave station→Master station)

Modbus TCP master station→LE7-40GU			
Device No.	Signal name		
400001	Continuous settings 1		
400002	Continuous settings 2		
400003	Request command 0	Request code 0	
400004	Setting data 0		
400005	Request command 1	Request code 1	
400006	Setting data 1		
400007	Continuous settings 3		
400008	Continuous settings 4		
400009	Request command 2	Request code 2	
400010	Setting data 2		
400011	Request command 3	Request code 3	
400012	Setting data 3		
400013 to 16	Unavailable		

Function code

The LE7-40GU (slave) supports the following function codes (subfunction codes).

Function code (Subfunction code)	Function	Number of accessible device one [unit: points]
0x01	Read Coils	1 to 2000
0x02	Read Discrete Inputs	1 to 2000
0x03	Read Holding Registers	1 to 125
0x04	Read Input Registers	1 to 125
0x05	Write Single Coil	1
0x06	Write Single Register	1
0x0F	Write Multiple Coils	1 to 1968
0x10	Write Multiple Register	1 to 123

Continuous setting/continuous monitoring

Data specified in advance can be set and monitored continuously by setting the continuous setting execution (RY2E) and continuous monitor execution (RY2E) in the master station to ON.

For continuous setting data, the data set for RAM writing is not stored during a power failure.

The latest data existing in LE7-40GU when the master station gives the send request can be monitored continuously.

However, regarding the update of parameters for which the monitor update cycle is specified by the setting in LE7-40GU, the data is updated in the specified update cycle if the specified update cycle is longer than the monitor update cycle in the send request given by the master station.

Continuous settings

1. Data write to devices with continuous settings 1 to 16
2. Turn on continuous settings execution

Continuous monitor

1. Turn on continuous monitor execution
2. Read the data of the devices of continuous monitors 1 to 16

Access by request command

For any access to data in LE7-40GU from the master station, data can be read and written by handshake between the "request command execution (RY2F)" flag and the "request command completion (RX2F)" flag.

This access is performed using a 2-word word device of the master station.

This 2-word data is comprised of the request command, to which the upper 4 bits of the first word are assigned, and the request code, to which the lower 12 bits are assigned, and the setting data, to which the next word is assigned.

bit 15 to 12	bit 11 to 0
Request command	Request code
Setting data	

There are three types of request command, Data Monitor, Writing to RAM, and Writing to RAM + ROM, according to the selection of data reading and writing method.

Monitor	Writing to RAM	Writing to RAM + ROM
Writing data is reflected in the settings based on a data read request from the master station but is not stored in the case of a power failure.	Writing data is reflected in the settings based on a data write request from the master station but is not stored in the case of a power failure.	Perform the above RAM write + data power failure write.

In the ROM for storage against power interruption, the allowable number of times of writing is limited. Accordingly, data cyclically written and updated by the PLC must be written only to the RAM.

Request command	Contents of execution	Execution result
H0	Monitor	Monitored value
H1	Writing to RAM	Writing result
H2	Writing to RAM + ROM	Writing result

The request code is the data number (address) of the data that executes the request command. The subsequent data setting is the data to be written to the data number, and if the request command is the monitor, the data setting data is ignored. When double word data is written to send data in the master station, and the handshake is executed by turning ON/OFF the request command execution flag and request command completion flag as follows, LE-70GU sends back the request command execution request.

1. The master station is set to request command execution ON.
2. LE7-40GU executes processing when receiving turning ON of the request command execution by the master station.
3. LE7-40GU turns ON the request command completion.
4. The master station receives the request command completion ON.
5. The master station is set to request command execution OFF.
6. LE7-40GU receives turning OFF of the request command execution by the master station.
7. LE7-40GU turns OFF the request command completion.
8. The master station receives the request command completion OFF.

Please perform reading of the execution results of the request command between step 4 and 5 of the handshake procedure. If an error occurs, in the execution result with respect to the request command from the master station, turn on the network alarm occurrence flag and output the device number where the alarm occurred to the network alarm device number monitor. For the request command execution result, refer to the following.

 LE7-CCL APPLICATION MANUAL

Request code

The numerical value of each parameter corresponding to the request code is treated as real number data without a decimal point.

In addition, the minimum and maximum values are determined for LE7-40GU, and when a value exceeding this data is written, it is automatically rewritten to the minimum or maximum value.

In this case, an "Out of data range" alarm is generated.

Request code	Name	Monitor/ settings	Extension option	Minimum value	Maximum value	Unit

Precautions

■About transmission delay

"Transmission delay" is a setting for low-speed devices that cannot respond quickly to transmission responses.

"Transmission delay" is initially set to 0 ms and it is necessary to set it with GT Designer3 (GOT2000) in order to change it.

For details on settings, refer to the following..

 GOT2000 Series Connection Manual (Microcomputers, MODBUS/Fieldbus Products, Peripherals)

■Error code (MODBUS Exception Codes) returned by LE7-40GU (slave) to the MODBUS master equipment

LE7-40GU (slave) supports the following error codes (MODBUS Exception Codes) in response to a request from the MODBUS master equipment.

When the following errors occur, LE7-40GU will not generate a system alarm.

This section explains the contents, cause, and remedy for each error code.

- Commonly generated error codes for requests from master equipment

Error code (HEX)	Category	Contents	Cause	Remedy
0x01	—	ILLEGAL FUNCTION (illegal function code)	A function code not supported by LE7-40GU was received.	A function code not supported by LE7-40GU was received.

- Error code generated in response to a read request from the master equipment

Error code (HEX)	Category	Contents	Cause	Remedy
0x02	Read/Write	ILLEGAL DATAADDRESS (illegal data address)	You have accessed a device out of range.	Please check whether the device to be accessed is incorrect.

- Error code generated in response to a write request from the master equipment

Error code (HEX)	Category	Contents	Cause	Remedy
0x02	Read/Write	ILLEGAL DATAADDRESS (illegal data address)	You have accessed a device out of range.	Please check whether the device to be accessed is incorrect.
0x03	Write	ILLEGAL DATA VALUE (illegal data value)	The consistency of the request packet (the number of writing points, the number of bytes of write data and the number of write data) is not established.	Make sure that normal packets are being transmitted from the master equipment.

5.3 Reference Program

A basic example program (GX Works3) for MODBUS/TCP (SLAVE) communication is described.

Using method of ladder

1. Turn ON X10 (start communication), and connect with LE7-40GU.
2. After X10 is executed, the required data for D100 to D133 are stored, and each function is executed in X20 to X24.

List of used devices (The allocation is an example.)

Device name	Classification ^{*1}	Allocation function	Use
X10	Setting	Communication start	OPEN process to LE7-40GU (Active device) is performed, and after OPEN normal completion, communication by MODBUS/TCP protocol is started. (Turn on 5 seconds after turning on the power supply of LE7-40GU.) ^{*2*3}
D100 to D106	Setting	Request command + request code/data setting 0 to 3	Device set to use the request command
D110 to D113	Setting	Request command execution result 0 to 3	Request command execution result is stored.
D120 to D127	Setting	Continuous monitor 1 to 4	Continuous monitor execution result is stored.
D130 to D133	Setting	Continuous setting 1 to 3	Setting value of continuous setting is stored.
X20	Setting	Start request command access execution	Execute request command.
X21	Setting	Start continuous monitor execution	Start to execute continuous monitor.
X22	Setting	Start continuous setting execution	Start to execute continuous setting.
X23	Setting	Start stall execution	Start to execute stall.
X24	Setting	Start operation	Start to operate.
Y30	Monitoring	Run	Run: ON/Stop: OFF
Y31	Monitoring	Manual control	Manual control ON
Y32	Monitoring	Automatic control	Automatic control ON
Y33	Monitoring	Auto lamp flicker in operation	Auto lamp flicker in operation ON
Y34	Monitoring	Request command completion	ON when request command is completed
Y35	Monitoring	Continuous monitor being executed	ON when continuous monitor is being executed.
Y36	Monitoring	Continuous settings being executed	ON when continuous setting is being executed.
Y100	Monitoring	OPEN execution status flag	This flag is turned on during the execution of FB for OPEN process. ^{*2}
Y101	Monitoring	OPEN normal completion flag	This flag is turned on when FB for OPEN process is completed normally. ^{*2}
Y102	Monitoring	OPEN abnormal completion flag	This flag is turned on when FB for OPEN process is completed abnormally. ^{*2}
Y103	Monitoring	CLOSE execution status flag	This flag is turned on during the execution of FB for CLOSE process. ^{*2}
Y104	Monitoring	CLOSE normal completion flag	This flag is turned on when FB for CLOSE process is completed normally. ^{*2}
Y105	Monitoring	CLOSE abnormal completion flag	This flag is turned on when FB for CLOSE process is completed abnormally. ^{*2}
Y106	Monitoring	Protocol execution complete flag	ON for one scan by a completion of SP.ECPRTCL instruction ^{*2}
D50	Monitoring	Error code during OPEN error	An error code is stored at the time of abnormal completion. ^{*2}
D51	Monitoring	Error code during CLOSE error	An error code is stored at the time of abnormal completion. ^{*2}
D0 to D16	System	Device for SP.ECPRTCL	Device used in an application instruction SP.ECPRTCL ^{*3}
D1000 to D1134	System	Device for protocol No. 1 (04: RD IN Register)	Store the data used in protocol communication. ^{*4}
D2000 to D2134	System	Device for protocol No. 2 (16: WR Multi Register)	

- *1 Classification
 - Setting: items to be set/input when using functions
 - Monitoring: items to monitor output when using functions
 - System: Used for internal processing, setting is unnecessary
- *2 For details of the device, refer to the following.
 -  MELSEC iQ-R Ethernet/CC-Link IE Function Block Reference
- *3 For details of the device, refer to the following.
 -  MELSEC iQ-R Programming Manual (Instructions, Standard Functions/Function Blocks)
- *4 For details of the device, refer to the following.
 -  MELSEC iQ-R Ethernet User's Manual (Application)

6 N:N NETWORK

LE7-40GU can be operated as a local station for FX PLC N:N network communication.

Data monitoring and parameter writing from a master station FX PLC for up to seven local stations (LE7-40GU units) can be carried out.

Precautions

- For 5 seconds after turning on the power of LE7-40GU, data from master station will not be accepted.
- Initial setting of LE7-40GU can not be done only with N:N Network.
- Simultaneous use of N:N Network and CC-Link communication is not possible.

6.1 System Configuration

Connection equipment	Communication form	Connection cable	Tension controller (Local station)		Connectable No. of units
		Cable type name	Optional equipment	Main unit	
FX5 PLC (master station)	RS-485	User created	— (Built-in to main unit)	LE7-40GU	Up to seven local stations (LE7-40GU) from the master station

6.2 Wiring

This section describes wiring.

Selection of cable

Use the following procedure to select cables.

Twisted pair cable

Use a shield twisted pair wire for connection with RS-485 communication equipment.

■RS-485 cable specification

Item	Specifications
Cable type	Shielded cable
Pairs	2 p, 3 p
Conductor resistance (20°C)	88.0 Ω/km or less
Insulation resistance	10000 MΩ·km or more
Withstand voltage	500 V DC1 minute
Capacitance (1 kHz)	An average of 60 nF/km or less
Characteristic impedance (100 kHz)	110±10 Ω

Construction drawing of the cables (reference)

Construction drawing example of a two twisted-pair cable

Construction drawing example of a three twisted-pair cable

Spring clamp terminal block

Connection to LE7-40GU should be performed as the following procedure.

Wire size

No. of wire per terminal	Wire size		
	Single wire/Strandwire	Ferrules with insulation sleeve	Ferrules without insulation sleeve
One wire	AWG24 to 16	AWG23 to 16	AWG23 to 16

Treatment of wire ends

Strip the cable about 10 mm from the tip to connect a wire ferrule at the striped area. Failure to do so may result in electric shock or short circuit between adjacent terminals because of the conductive part. If the wire strip length is too short, it may result in the poor contact to the spring clamp terminal part.

When using a wire ferrule with an insulating sleeve, choose a wire with proper cable sheath referring to the above outside dimensions, otherwise the wire cannot be inserted easily.

- Strand wire/single wire

The following table shows wire ferrules and tools for wire ferrules compatible with the terminal block. Use of items other than these may result in not being able to remove the wire ferrule, so carefully check that the wire ferrule can be unplugged.

<Reference product>

Manufacturer	Model	Wire size	Crimp tool
PHOENIX CONTACT GmbH & Co. KG	AI 0.5-10 WH	0.5 mm ²	CRIMPFOX 6
	AI 0.75-10 GY	0.75 mm ²	
	A 1.0-10	1.0 mm ²	
	A 1.5-10	1.5 mm ²	

Connection and disconnection of the cable

Spring clamp terminal block is push-in type, therefore, wiring without a tool is possible by simply inserting the connecting terminal to the terminal block. However, the stranded wire does not comply with the push-in type, and a tool is required for connecting cables.

- Connection of the cable

Fully insert a cable or bar solderless terminal whose end has been properly processed into the wire insertion opening.

If the cable or bar solderless terminal cannot be inserted with this procedure, fully insert the cable or bar solderless terminal while pushing the open/close button with a flathead screwdriver having a tip width of 2.0 to 2.5 mm. After fully inserting the cable, remove the screwdriver.

Do not tighten terminal screws exceeding the specified torque range. Otherwise it may cause equipment failure or malfunction.

When wiring with the thick electric wire, make sure to prevent the conductive parts from protruding to the front of the terminal block.

<Reference>

Manufacturer	Model
PHOENIX CONTACT GmbH & Co. KG	SZS 0.4×2.5 VDE

- Disconnection of the cable

While pushing the open/close button with a flathead screwdriver having a tip width of 2.0 to 2.5 mm, disconnect the cable or bar solderless terminal.

Terminating resistor settings

Be sure to install terminating resistors at both ends of the line.

LE7-40GU, the built-in RS-485 port of the CPU module, FX5-485-BD, and FX5-485ADP, have built-in terminating resistors.

Set to 110 Ω with the terminating resistor changeover switch.

■LE7-40GU (Left side)

■FX5U CPU module built-in RS-485 port

■FX5UC CPU module built-in RS-485 port

■FX5-485-BD

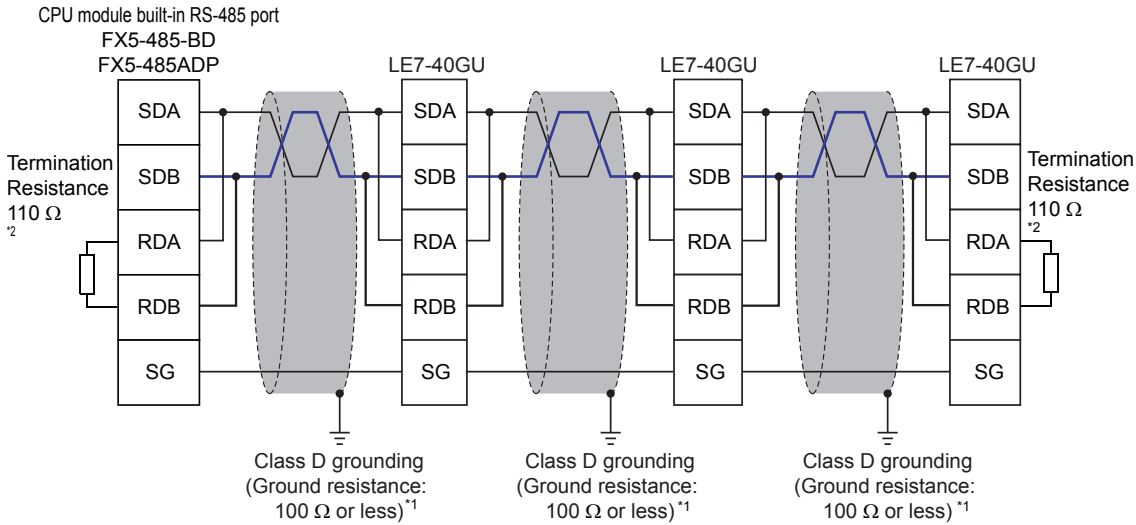

■FX5-485ADP

Connection diagram

Use single pair wiring for N:N Network wiring.

*1 Be sure to apply Class D grounding to the shield of the twisted pair cable to be connected.
 *2 Terminal resistor should be attached to both ends of the line. LE7-40GU, the built-in RS-485 port of the CPU module, FX5-485-BD, and FX5-485ADP, have built-in terminating resistors. Set the terminal resistor with the selector.

Grounding

Grounding should be performed as stated below.

- Perform Class D grounding. (Ground resistance: 100 Ω or less)
- Independent grounding should be performed for best results.
- When independent grounding cannot be performed, perform "shared grounding" as shown in the following figure.

The grounding wire size should be AWG 24 to 16 (cross-section area: 0.2 to 1.5 mm²).

The grounding point should be close to the tension controller, and all grounding wires should be as short as possible.

6.3 Communication Setting

Communication specifications

The communication specification of the N:N Network is as follows.

Communication specifications	
Item	Specifications
Transmission standard	Conforms to RS-485 standard
Maximum transmission distance	50 m
Communication method	Bidirectional half-duplex
Wiring method	One-pair wiring
Communication procedure	N:N Network (pattern 2 only)
Transmission speed (baud rate)	N:N Network: 38,400 (bps)
Insulation	Non-isolated (between the communication line and CPU)

Link pattern

LE7-40GU supports pattern 2 as a link pattern.

For pattern 2, it is possible to exchange link data of 64 bit devices (M) and 8 word devices (D) at each station.

This is used to monitor and configure the local stations from the master station.

Station No.		Pattern 2	
		Bit device (M)	Word device (D)
		64 devices per station	8 devices per station
Master station	Station No. 0	M1000 to M1063	D0 to D7
Local station	Station No. 1	M1064 to M1127	D10 to D17
	Station No. 2	M1128 to M1191	D20 to D27
	Station No. 3	M1192 to M1255	D30 to D37
	Station No. 4	M1256 to M1319	D40 to D47
	Station No. 5	M1320 to M1383	D50 to D57
	Station No. 6	M1384 to M1447	D60 to D67
	Station No. 7	M1448 to M1511	D70 to D77

Communication parameter settings

6

When using N:N Network, set the communication parameters with the following procedure.

1. On the LE7-40GU screen "Network mode selection" screen, select "N:N Network".

2. Change to 1 to 7*1 in accordance with the local station No. to be assigned with the "N:N Network station No. setting" on the LE7-40GU screen, in accordance with the local station No. to be assigned.

3. Restart LE7-40GU.

*1 If the set value is "0", N:N Network will not operate.

Link data configuration

The contents of the link data differs depending on the master and local station areas.

The following shows the details of device M and D.

- Device M configuration of the master station

Device No.	Signal name	Signal name ON (data value=1)	OFF (data value=0)

Dn+6	Request command 0 execution result
Dn+7	Request command 1 execution result

Station Number command

The D device (D 0) station No. command of the master station determines the station No. of the local station to be accessed. By setting the station No. command to 0, simultaneous setting and simultaneous monitoring can be performed for all local stations.

Station No. command	Function
1 to 7	Individual access to the specified local station
0	Simultaneous access to all the local stations

Continuous setting/continuous monitoring

When continuous setting execution and continuous monitor execution of the master station are turning on, data set by continuous setting function selection and continuous monitoring function selection can be set and monitored continuously. For continuous setting data, the data set for RAM writing is not stored in a power failure.

Continuous monitor data can monitor the latest data of the local station at the time when there is a transmission request from the master station.

However, in updating parameters with a monitor update period in the setting of the local station, if this update period setting is longer than the transmission request from the master station, data update is performed by this update cycle.

Continuous settings

1. Data write to devices with continuous settings 1 to 16
2. Turn on continuous settings execution.

Continuous monitor

1. Turn on continuous monitor execution.
2. Read the data of the devices of continuous monitors 1 to 16.

Access by request command

For any data access from the master station to the local station, data can be read or written by handshaking between the "request command execution" flag and the "request command completion" flag.

This access is performed using a 2-word word device of the master station.

In the double word data, the 4 high-order bits of the first word are assigned to the request command and the 12 low-order bits are assigned to the request code, and the second word is assigned as the word for the set data.

bit 15 to 12	bit 11 to 0
Request command	Request code
Setting data	

There are three types of request command, Data Monitor, Writing to RAM, and Writing to RAM + ROM, according to the selection of data reading and writing method.

Monitor	Writing to RAM	Writing to RAM + ROM
Writing data is reflected in the settings based on a data read request from the master station but is not stored in the case of a power failure.	Writing data is reflected in the settings based on a data write request from the master station but is not stored in the case of a power failure.	Perform the above RAM write + data power failure write.

In the ROM for storage against power interruption, the allowable number of times of writing is limited. Accordingly, data cyclically written and updated by the PLC must be written only to the RAM.

Request command	Contents of execution	Execution result
H0	Monitor	Monitored value
H1	Writing to RAM	Writing result
H2	Writing to RAM + ROM	Writing result

The request code indicates the data No. (address) of data for which the request command is executed. Also, the subsequent data setting is the data to be written to that data number.

If the request command is a monitor, the data setting data is ignored.

When double word data is written to send data in the master station, and the handshake is executed by turning ON/OFF the request command execution flag and request command completion flag as follows, the local station sends back the request command execution request.

1. The master station is set to request command execution ON.
2. The local station processes in accordance with the master station request command execution ON.
3. The local station is set to request command completion ON.
4. The master station receives the request command completion ON.
5. The master station is set to request command execution OFF.
6. The local station receives the request command execution OFF from the master station.
7. The local station is set to request command completion OFF.
8. The master station receives the request command completion OFF.

Please perform reading of the execution results of the request command between step 4 and 5 of the handshake procedure.

If an error occurs, triggered by the request command from the master station, the local station turns ON the network alarm occurrence flag and outputs the device No. that has the error to the monitor of the device number of the network alarm.

For the request command execution result, refer to the following.

 LE7-CCL APPLICATION MANUAL

Request code

The numerical value of each parameter corresponding to the request code is treated as real number data without a decimal point.

In addition, the minimum and maximum values are determined for LE7-40GU, and when a value exceeding this data is written, it is automatically rewritten to the minimum or maximum value.

In this case, an "Out of data range" alarm is generated.

Request code	Name	Monitor/ settings	Extension option	Minimum value	Maximum value	Unit

6.4 Reference Program

A basic example program (GX Works3) for N:N Network is described.

System configuration

Setting

Basic settings

The screenshot shows the GX Works3 software interface. The 'Setting Item List' window on the left shows a tree view with 'Basic Settings', 'Fixed Setting', 'Link Device', and 'SM/SD Setting'. The 'Setting Item' window on the right shows the 'Communication Protocol Type' setting, which is set to 'N:N Network'. Below the setting, there is an 'Explanation' section that says 'Set communication protocol type.' and buttons for 'Check', 'Restore the Default Settings', and 'Apply'.

Item	Setting
Communication protocol type	N:N Network

Fixed setting

The screenshot shows the GX Works3 software interface. The 'Setting Item List' window on the left shows a tree view with 'Basic Settings', 'Fixed Setting', 'Link Device', and 'SM/SD Setting'. The 'Setting Item' window on the right shows several fixed settings: 'Host Station No.' set to '0(Master)', 'Total Number of Local Station' set to '1', 'Refresh Range' set to '2', 'Timeout Retry Count Setting' set to '3', and 'Monitoring Time' set to '50 ms'. Below the settings, there is an 'Explanation' section that says 'Set host station No.' and buttons for 'Check', 'Restore the Default Settings', and 'Apply'.

Item	Setting
Host station No.	0(master)
Total number of local station	1
Refresh range	2
Timeout retry count setting	3
Monitoring time	50 ms

■ Link device

Setting Item List

Input the Setting Item to Search

- Basic Settings
- Fixed Setting
- Link Device
- SM/SD Setting

Setting Item

Item	Setting
Link Device Bit	Set the start device number of the bit device for linking.
Device	M1000
Link Device Word	Set the start device number of the word device for linking.
Device	D0

Explanation

Set the start device number of the bit device for linking.

Check Restore the Default Settings Apply

Item	Setting
Link device bit	M1000
Link device word	D0

■ SM/SD setting

Setting Item List

Input the Setting Item to Search

- Basic Settings
- Fixed Setting
- Link Device
- SM/SD Setting

Setting Item

Item	Setting
Latch Setting	Set the latch of SM/SD device.
Host Station No.	Do Not Latch
Total Number of Local Station	Do Not Latch
Refresh Range	Do Not Latch
Timeout Retry Count Setting	Do Not Latch
Monitoring Time	Do Not Latch
FX3 Series Compatibility	Set the SM/SD device compatible with the FX3 series.
SM/SD for Compatibility	Disable

Explanation

Set the latch of SM/SD device.

Check Restore the Default Settings Apply

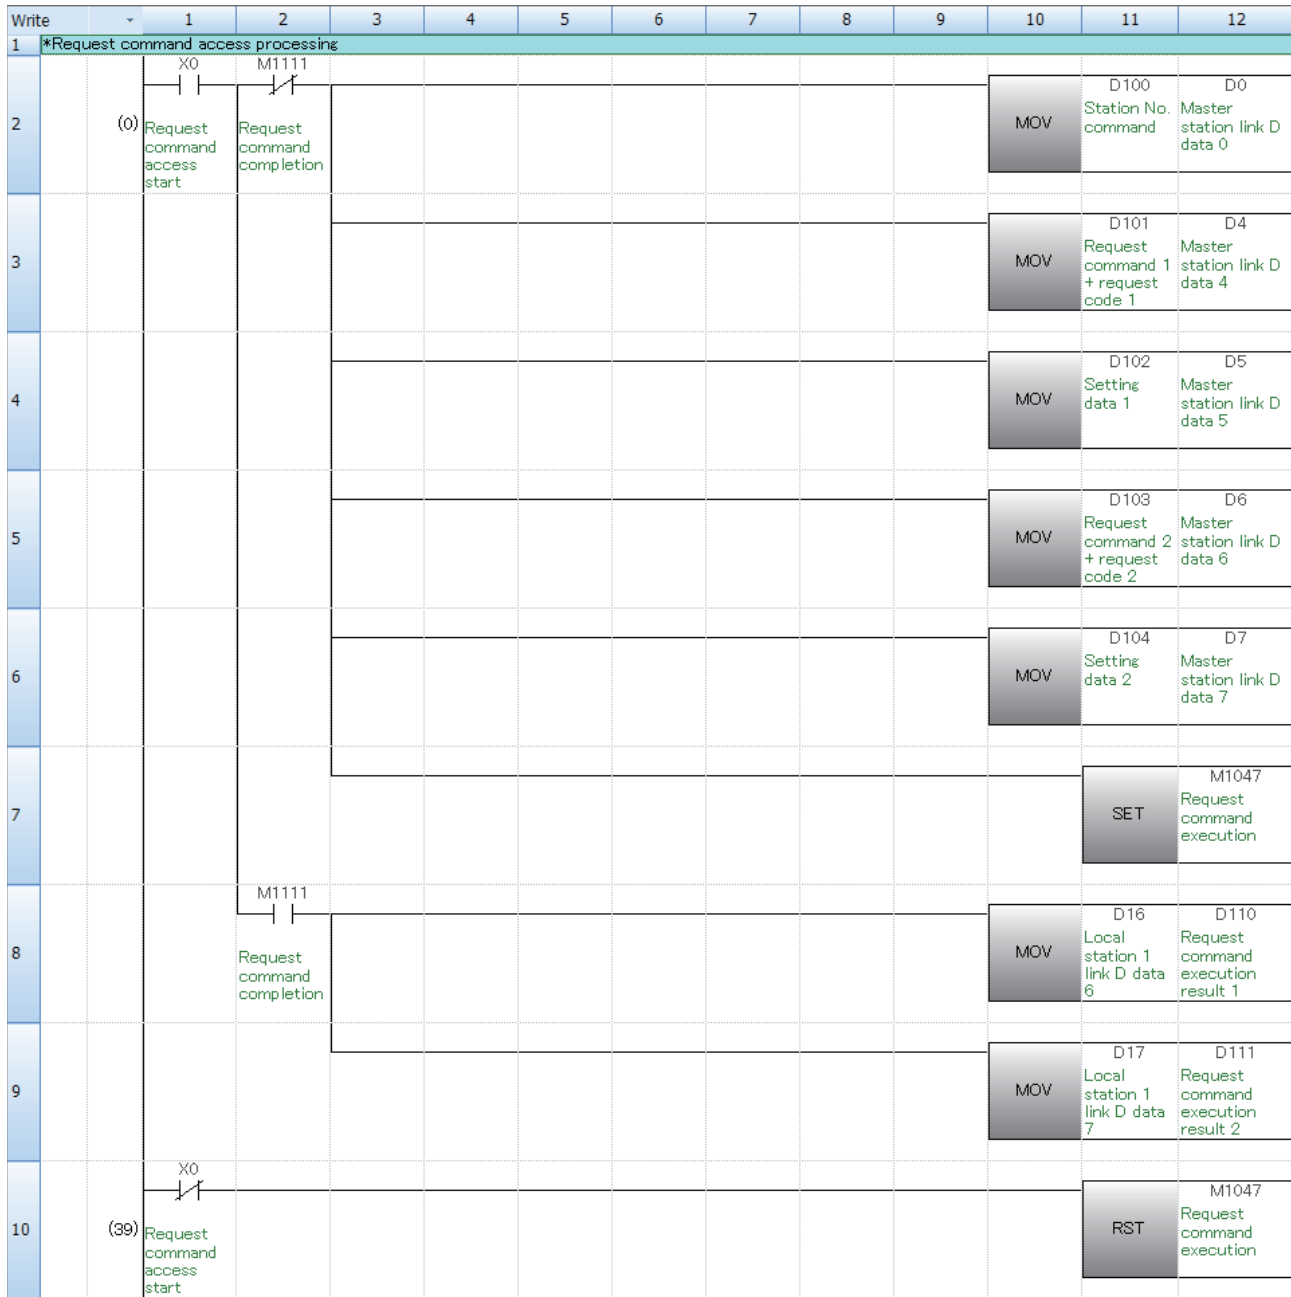

Latch setting

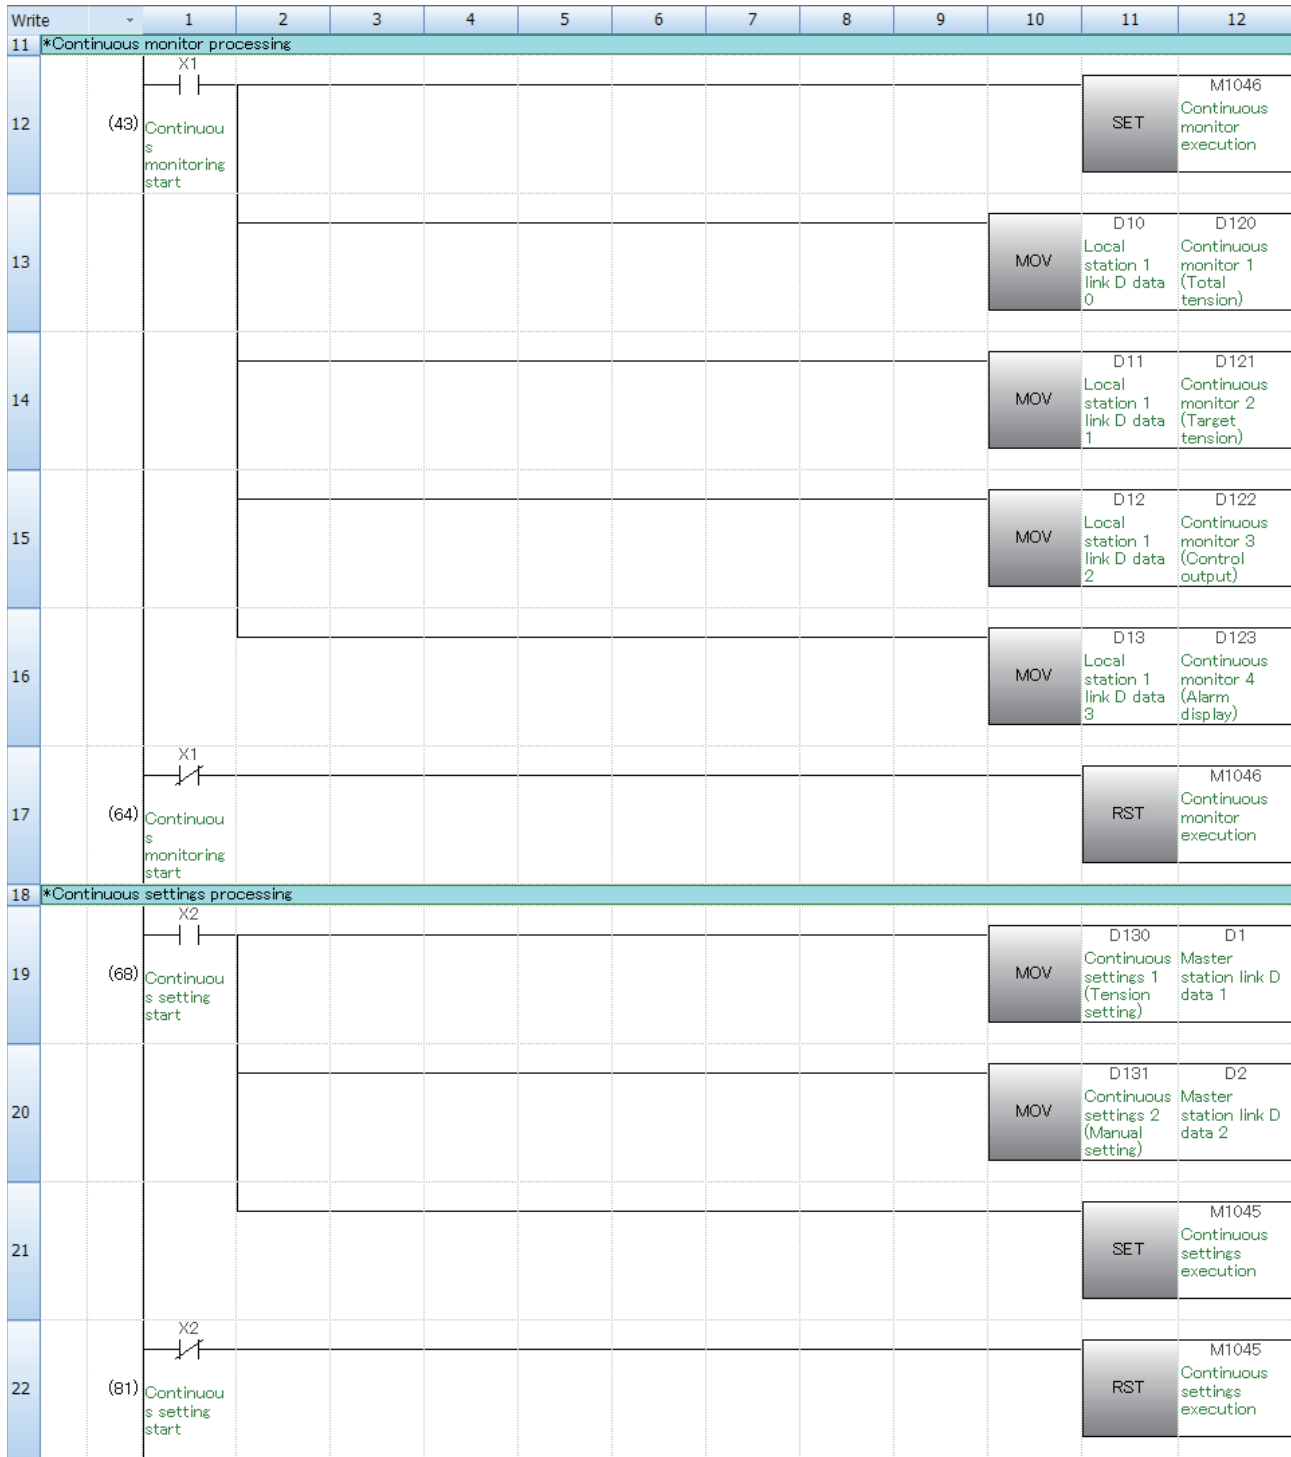

Item	Setting
Host station No.	Do not latch
Total number of local station	Do not latch

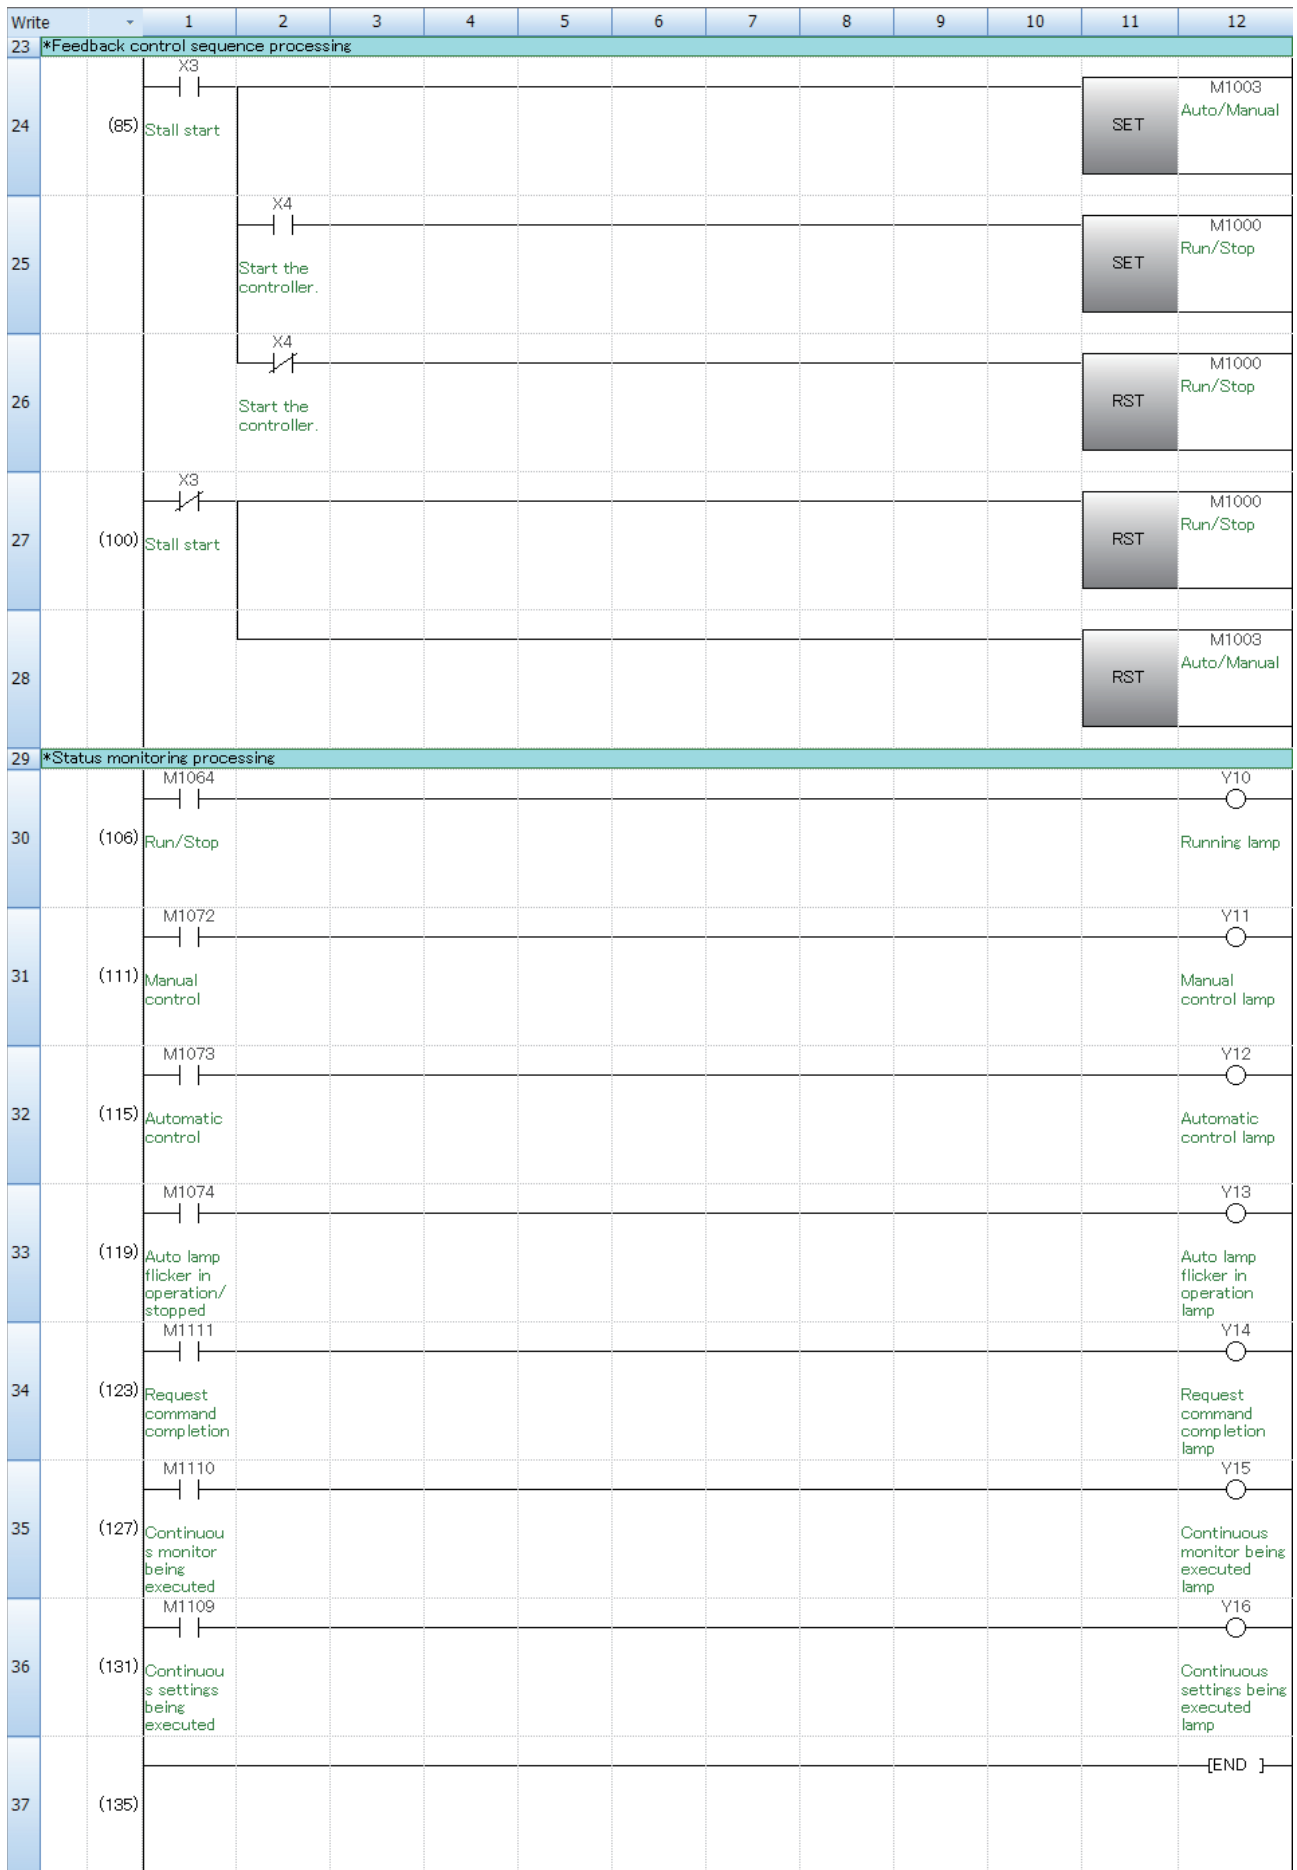

FX3 series compatibility

Item	Setting
SM/SD for compatibility	Disable

Program example

Using method of ladder

Required data is stored to D100 to D131, and each function is executed in X0 to X4.

List of used devices (The allocation is an example.)

Device name	Classification ^{*1}	Allocation function	Use
D100	Setting	Station No. command	Device set for individual access to each station No.
D101 to D104	Setting	Request command + request code/data setting 1 to 2	Device set to use the request command
D110 to D111	Monitoring	Request command execution result 1 to 2	Request command execution result is stored.
D120 to D123	Monitoring	Continuous monitor 1 to 4	Continuous monitor execution result is stored.
D130 to D131	Setting	Continuous setting 1 to 2	Setting value of continuous setting is stored.
X0	Setting	Start request command access execution	Execute request command.
X1	Setting	Start continuous monitor execution	Start to execute continuous monitor.
X2	Setting	Start continuous setting execution	Start to execute continuous setting.
X3	Setting	Start stall execution	Start to execute stall.
X4	Setting	Start operation	Start to operate.
Y10	Monitoring	Run	Run: ON/Stop: OFF
Y11	Monitoring	Manual control	Manual control ON
Y12	Monitoring	Automatic control	Automatic control ON
Y13	Monitoring	Auto lamp flicker in operation	Auto lamp flicker in operation ON
Y14	Monitoring	Request command completion	ON when request command is completed
Y15	Monitoring	Continuous monitor being executed	ON when continuous monitor is being executed.
Y16	Monitoring	Continuous settings being executed	ON when continuous setting is being executed.

*1 Classification

Setting: items to be set/input when using functions

Monitoring: items to monitor output when using functions

7 MODBUS/RTU, ASCII (SLAVE)

LE7-40GU can be operated as a slave station for MODBUS/RTU and ASCII communication.

Data monitoring and parameter writing from a master station for up to 247 slave stations (LE7-40GU units) can be carried out.

Precautions

- For 5 seconds after turning on the power of LE7-40GU, data from master station will not be accepted.
- Initial setting of LE7-40GU can not be done only by MODBUS communication.
- Simultaneous use of MODBUS communication and CC-Link communication is not possible.

7.1 System Configuration

Connection equipment	Communication form	Connection cable		Tension controller (Slave station)		Number of connectable devices
		Cable type name	Longest distance	Optional equipment	Main unit	
MODBUS/RTU, ASCII master device	RS-485	User created	1200 m ^{*1}	— (Built-in to main unit)	LE7-40GU	Up to 247 slave stations (LE7-40GU) from the master station

*1 The shortest specification on the MODBUS/RTU master device side takes precedence.

7.2 Wiring

This section describes wiring.

Selection of cable

Use the following procedure to select cables.

Twisted pair cable

Use a shield twisted pair wire for connection with RS-485 communication equipment.

■RS-485 cable specification

Item	Specifications
Cable type	Shielded cable
Pairs	2 p, 3 p
Conductor resistance (20°C)	88.0 Ω/km or less
Insulation resistance	10000 MΩ·km or more
Withstand voltage	500 V DC 1 minute
Capacitance (1 kHz)	An average of 60 nF/km or less
Characteristic impedance (100 kHz)	110±10 Ω

Construction drawing of the cables (reference)

Construction drawing example of a two twisted-pair cable

Construction drawing example of a three twisted-pair cable

Spring clamp terminal block

Connection to LE7-40GU should be performed as the following procedure.

Wire size

No. of wire per terminal	Wire size		
	Single wire/Strandwire	Ferrules with insulation sleeve	Ferrules without insulation sleeve
One wire	AWG24 to 16	AWG23 to 16	AWG23 to 16

Treatment of wire ends

Strip the cable about 10 mm from the tip to connect a wire ferrule at the striped area. Failure to do so may result in electric shock or short circuit between adjacent terminals because of the conductive part. If the wire strip length is too short, it may result in the poor contact to the spring clamp terminal part.

When using a wire ferrule with an insulating sleeve, choose a wire with proper cable sheath referring to the above outside dimensions, otherwise the wire cannot be inserted easily.

- Strand wire/single wire

- Ferrule with insulation sleeve

The following table shows wire ferrules and tools for wire ferrules compatible with the terminal block. Use of items other than these may result in not being able to remove the wire ferrule, so carefully check that the wire ferrule can be unplugged.

<Reference product>

Manufacturer	Model	Wire size	Crimp tool
PHOENIX CONTACT GmbH & Co. KG	AI 0.5-10 WH	0.5 mm ²	CRIMPFOX 6
	AI 0.75-10 GY	0.75 mm ²	
	A 1.0-10	1.0 mm ²	
	A 1.5-10	1.5 mm ²	

■ Connection and disconnection of the cable

Spring clamp terminal block is push-in type, therefore, wiring without a tool is possible by simply inserting the connecting terminal to the terminal block. However, the stranded wire does not comply with the push-in type, and a tool is required for connecting cables.

- Connection of the cable

Fully insert a cable or bar solderless terminal whose end has been properly processed into the wire insertion opening.

If the cable or bar solderless terminal cannot be inserted with this procedure, fully insert the cable or bar solderless terminal while pushing the open/close button with a flathead screwdriver having a tip width of 2.0 to 2.5 mm. After fully inserting the cable, remove the screwdriver.

Do not tighten terminal screws exceeding the specified torque range. Otherwise it may cause equipment failure or malfunction.

When wiring with the thick electric wire, make sure to prevent the conductive parts from protruding to the front of the terminal block.

<Reference>

Manufacturer	Model
PHOENIX CONTACT GmbH & Co. KG	SZS 0.4×2.5 VDE

- Disconnection of the cable

While pushing the open/close button with a flathead screwdriver having a tip width of 2.0 to 2.5 mm, disconnect the cable or bar solderless terminal.

Terminating resistor settings

Be sure to install terminating resistors at both ends of the line.

LE7-40GU, the built-in RS-485 port of the CPU module, FX5-485-BD, and FX5-485ADP, have built-in terminating resistors. Set the terminating resistance with the terminating resistor changeover switch.

Wiring	Termination resistance changeover switch
Two-pair wiring	330 Ω
One-pair wiring	110 Ω

■LE7-40GU (Left side)

■FX5U CPU module built-in RS-485 port

■FX5UC CPU module built-in RS-485 port

■FX5-485-BD

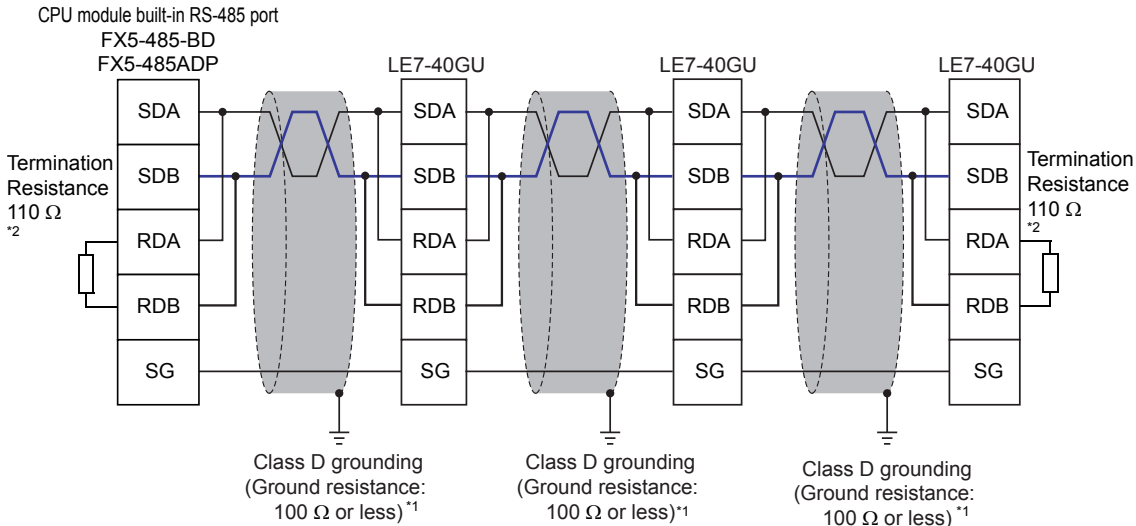

■FX5-485ADP

Connection diagram

The wiring shown below is a wiring example when the master station is an FX series PLC. If the pin number of the partner side is different, please wire as shown below according to the pin name.

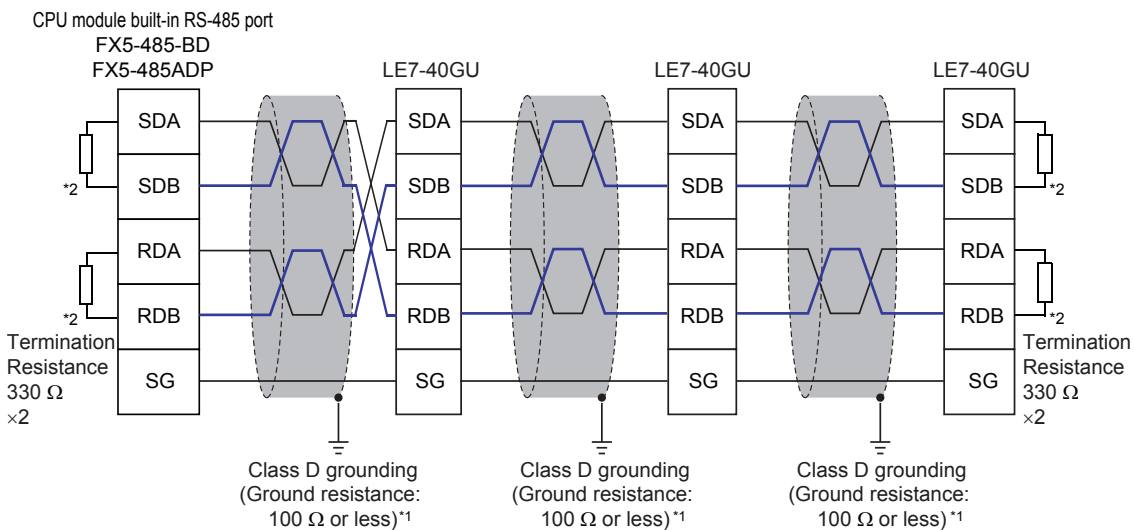

One-pair wiring (master station: FX series PLC)

*1 Be sure to apply Class D grounding to the shield of the twisted pair cable to be connected.

*2 Terminal resistor should be attached to both ends of the line. LE7-40GU, the built-in RS-485 port of the CPU module, FX5-485-BD, and FX5-485ADP, have built-in terminating resistors. Set the terminating resistor selector to 110Ω.

Two-pair wiring (master station: FX series PLC)

*1 Be sure to apply Class D grounding to the shield of the twisted pair cable to be connected.

*2 Terminal resistor should be attached to both ends of the line. LE7-40GU, the built-in RS-485 port of the CPU module, FX5-485-BD, and FX5-485ADP, have built-in terminating resistors. Set the terminating resistor selector to 330Ω.

Grounding

Grounding should be performed as stated below.

- Perform Class D grounding. (Ground resistance: 100 Ω or less)
- Independent grounding should be performed for best results.
- When independent grounding cannot be performed, perform "shared grounding" as shown in the following figure.

The grounding wire size should be AWG 24 to 16 (cross-section area: 0.2 to 1.5 mm²).

The grounding point should be close to the tension controller, and all grounding wires should be as short as possible.

7.3 Communication Setting

Communication specifications

The communication specifications of MODBUS/RTU, ASCII communication are as follows.

Communication specifications

Item	Specifications	
Transmission standard	RS-485 standard	
Channels	1 channel	
Transmission specifications	Communication method	Single master/multislave system
	Wiring method	One-pair wiring, two-pair wiring
	Transmission speed (baud rate)	The following can be chosen from. 1200, 2400, 4800, 9600, 19200, 38400, 57600, 115200 (bps)
	Data length ^{*1}	7 or 8 bits
	Frame mode	RTU or ASCII
Slave function (LE7-40GU)	Number of request messages that can be simultaneously accepted	1 request
	Station No.	1 to 247
	Maximum size of data that can be written	64 words ^{*2} or 1968 coils
	Maximum size of data that can be read	125 words or 2000 coils

*1 In RTU mode, set the data length to 8 bits.

*2 Maximum number of write words in one communication of LE7-40GU.

Used coil/holding register

The coil and holding register used for MODBUS communication of LE7-40GU are as follows.

The coil is an area to store bit data and the holding register is an area to store word data. Each slave station has coils from H0000 to H02F and H1000 to H102F as well as holding registers from H0000 to H015F and H1000 to H115F.

The usage of each kind of address is as follows.

- Coil (for Master station→Slave station)

An area in which the master station writes an instruction to the slave station

- Coil (for Slave station→Master station)

An area in which the slave station writes the execution result of the instruction from the master station.

By reading the area of this coil from the master station, it becomes possible to monitor the instruction execution result of the slave station by the master station.

- Holding register (for master station monitoring)

The status of the slave station monitored by the master station is stored in this area.

Slave station monitoring is performed by the master station by reading the area of the holding register by the master station.

- Holding register (for slave station RAM write)

An area to store data to be written to the RAM of the slave station.

- Holding register (for slave station RAM + ROM write)

An area to store the data to be written to the RAM and ROM of the slave station.

Type		Address	Data reading/writing by the master station
Coil (bit data)	For Master station→Slave station	H0000 to H002F	Writable
	For Slave station→Master station	H1000 to H102F	Readable
Holding register (word data)	For monitoring by the master station	H0000 to H015F	Readable
	For writing to RAM in the slave station		Readable/Writable
	For writing to RAM + ROM in the slave station	H1000 to H115F	Writable

Frame specifications

The frame specification of MODBUS communication is shown below.

The frame specification detail is as below.

No.	Area name	Direction	Contents
1	Address field	Master station→Slave station	0: Broadcast 1 to 247: Send the request message to the specified slave station.
		Slave station→Master station	Returns the own station No. of the slave station.
2	Function code	Master station→Slave station	Specify the function code that the master station instructs for the slave station.
		Slave station→Master station	<ul style="list-style-type: none"> • Normal completion: Returns the function code at the time of request. • Abnormal completion: Returns with the most significant bit ON.
3	Data	Master station→Slave station	Stores information for executing the function specified in the function code.
		Slave station→Master station	<ul style="list-style-type: none"> • Normal completion: Returns the execution result of the function specified by the function code. • Abnormal completion: Returns the error response code.
4	Error checking	Master station→Slave station	The sender computes the error check bit and gives it.
		Slave station→Master station	

Frame mode

There are two kinds of frame modes for the message which reads/writes the coil and holding registers.

■RTU mode

In RTU mode, frames are transmitted in binary code.

When the message is interrupted for a time corresponding to the communication time (depending on the transmission speed) of 3.5 characters, it is regarded as the end of the message.

Start	Address field	Function code	Data	Error check (CRC)	End (Start)	Address field
Interval of 3.5 character time or more	1 byte	1 byte	0 to 252 bytes	2 bytes	Interval of 3.5 character time or more	1 byte

■ASCII mode

This mode is used to transmit and receive frames in ASCII code characters (2 bytes).

Start	Address field	Function code	Data	Error check (LRC)	End
1 byte (3AH)	2 bytes	2 bytes	N × 2 bytes (N=0 to 252)	2 bytes	2 bytes ((0DH)+(0AH))

List of supported MODBUS standard functions

The following table lists supported MODBUS standard functions.

Function code	Function name	Description	Number of devices accessible in one message	Broadcast
01H	Coil reading	Coil reading (multiple points possible)	1 to 2000 points	×
03H	Holding register reading	Holding register reading (multiple points possible)	1 to 125 points	×
05H	Single coil writing	Coil writing (1 point only)	1 point	○
06H	Single register writing	Holding register writing (1 point only)	1 point	○
0FH	Multiple coil writing	Multiple point coil writing	1 to 1968 points	○
10H	Multiple register writing	Multiple point holding register writing	1 to 64 points	○

Communication parameter settings

With this communication function, communication setting of LE7-40GU is necessary.

Communication setting procedure

1. Select "MODBUS (RTU)" or "MODBUS (ASCII)" on the "Network mode selection" screen of the LE7-40GU screen.

2. According to the slave station No. to be assigned, change "Station No. in MODBUS" on the LE7-40GU screen, in accordance with the slave station No. to be assigned to a value within "1" to "247"*1.

*1 If the set value is "0", MODBUS will not operate.

3. Change with "MODBUS format selection" on the LE7-40GU screen according to the communication format to be used.

Bit	Name	Description	
		0 (bit=OFF)	1 (bit=ON)
b0	Data length*1	7 bit	8 bits
b1 b2	Parity	b2, b1 (0, 0): Unavailable (0, 1): Odd (1, 0): Unavailable*2 (1, 1): Even	
b3	Stop bit	1 bit	2 bits
b4 b5 b6 b7	Baud rate (bps)	b7, b6, b5, b4 (0, 0, 0, 0): Unavailable*2 (0, 0, 0, 1): Unavailable*2 (0, 0, 1, 0): Unavailable*2 (0, 0, 1, 1): Unavailable*2 (0, 1, 0, 0): Unavailable*2 (0, 1, 0, 1): 1200 (0, 1, 1, 0): 2400 (0, 1, 1, 1): 4800	b7, b6, b5, b4 (1, 0, 0, 0): 9600 (1, 0, 0, 1): 19200 (1, 0, 1, 0): 38400 (1, 0, 1, 1): 57600 (1, 1, 0, 0): Unavailable*2 (1, 1, 0, 1): 115200 (1, 1, 1, 0): Unavailable*2 (1, 1, 1, 1): Unavailable*2
b8 to b15	Unavailable	—	

*1 When setting network mode selection to 3: MODBUS (RTU), data length (b0)=7 bits cannot be set.

*2 When parity (b1-2) and baud rate (b4-7) are made unavailable, network mode selection=0 (no function), N:N Network station No.=1, MODBUS station No.=1, MODBUS communication format=0x0051 can be rewritten at the next power ON after the setting.

4. Restart LE7-40GU.

Data exchange between the master station and the slave station

The master station reads and writes data from/to the coil and holding registers of the slave station, enabling monitoring of the slave station and setting of parameters.

Coil (bit data)

■Coil for Master station→Slave station

An area used to write instructions to the slave station.

■Coil for Slave station→Master station

The execution result of the instruction is an area for writing.

Holding register (word data)

■For monitoring by the master station

The status of the slave station monitored by the master station is stored in this area.

■For writing to RAM in the slave station

Data to be written to the RAM in the slave station is stored in this area.

RAM writing data is reflected in the settings, but is not stored in the case of power failure.

It can be written only to LE7-40GU.

■For writing to RAM + ROM in the slave station

An area to store data to perform the above RAM writing + data power failure writing.

In the ROM for storage against power interruption, the allowable number of times of writing is limited. Accordingly, data cyclically written and updated by the PLC must be written only to the RAM.

7

Point

- The numerical value of each parameter is treated as real data without a decimal point. The data defines the minimum value and the maximum value within LE7-40GU and automatically rewrites it to the minimum value or the maximum value when writing data outside the range. At that time, a network alarm "22" is output to the alarm display (H00EB) of the holding register.
- For holding registers where change of password of monitor, parameter list of setting items="○", if the password setting and the password input do not match, the holding register cannot be written to, the monitor value of the holding register is rewritten with a numerical value of maximum value +1, and the set numerical value can no longer be monitored.
- If an error occurs triggered by the request from the master station, the slave station turns ON the coil of the network alarm occurrence flag (H101A), and outputs the address of the holding register that has the error to the holding register of the device number of the network alarm (H00EC).

- Configuration of coil (from master station to slave station)

The configuration of the coil is as follows.

Device No.	Signal name	Signal name ON (data value=1)	OFF (data value=0)
H0000(0)	Run/Stop	Run	Stop
H0001(1)	Reel change B axis/A axis	B axis control	A axis control
H0002(2)	Control output OFF/ON	Control output OFF	Control output ON
H0003(3)	Auto/Manual	Automatic control	Manual control
H0004(4)	Stall memory ON/OFF	Stall memory ON	Stall memory OFF

7.4 Reference Program

A basic example program (GX Works3) for MODBUS/RTU, ASCII(SLAVE) communication is described.

System configuration

Settings

Basic settings

Item	Setting
Communication Protocol Type	MODBUS_RTU Communication
Parity Bit	Even
Stop Bit	1bit
Baud Rate	115,200bps

Item	Setting
Communication protocol type	MODBUS_RTU Communication

Fixed setting

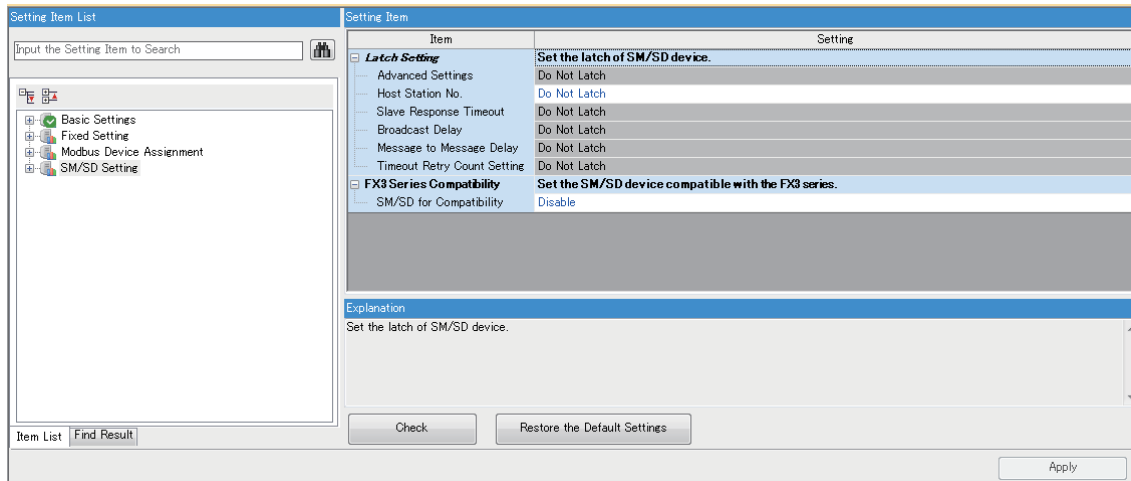

Item	Setting
Host Station No.	0
Slave Response Timeout	3000 ms
Broadcast Delay	400 ms
Message to Message Delay	1 ms
Timeout Retry Count Setting	5

Item	Setting
Host station No.	0
Slave response timeout	3000 ms
Broadcast delay	400 ms
Message to message delay	1 ms
Timeout retry count setting	5

■ Modbus device assignment

Setting is unnecessary.

■ SM/SD setting

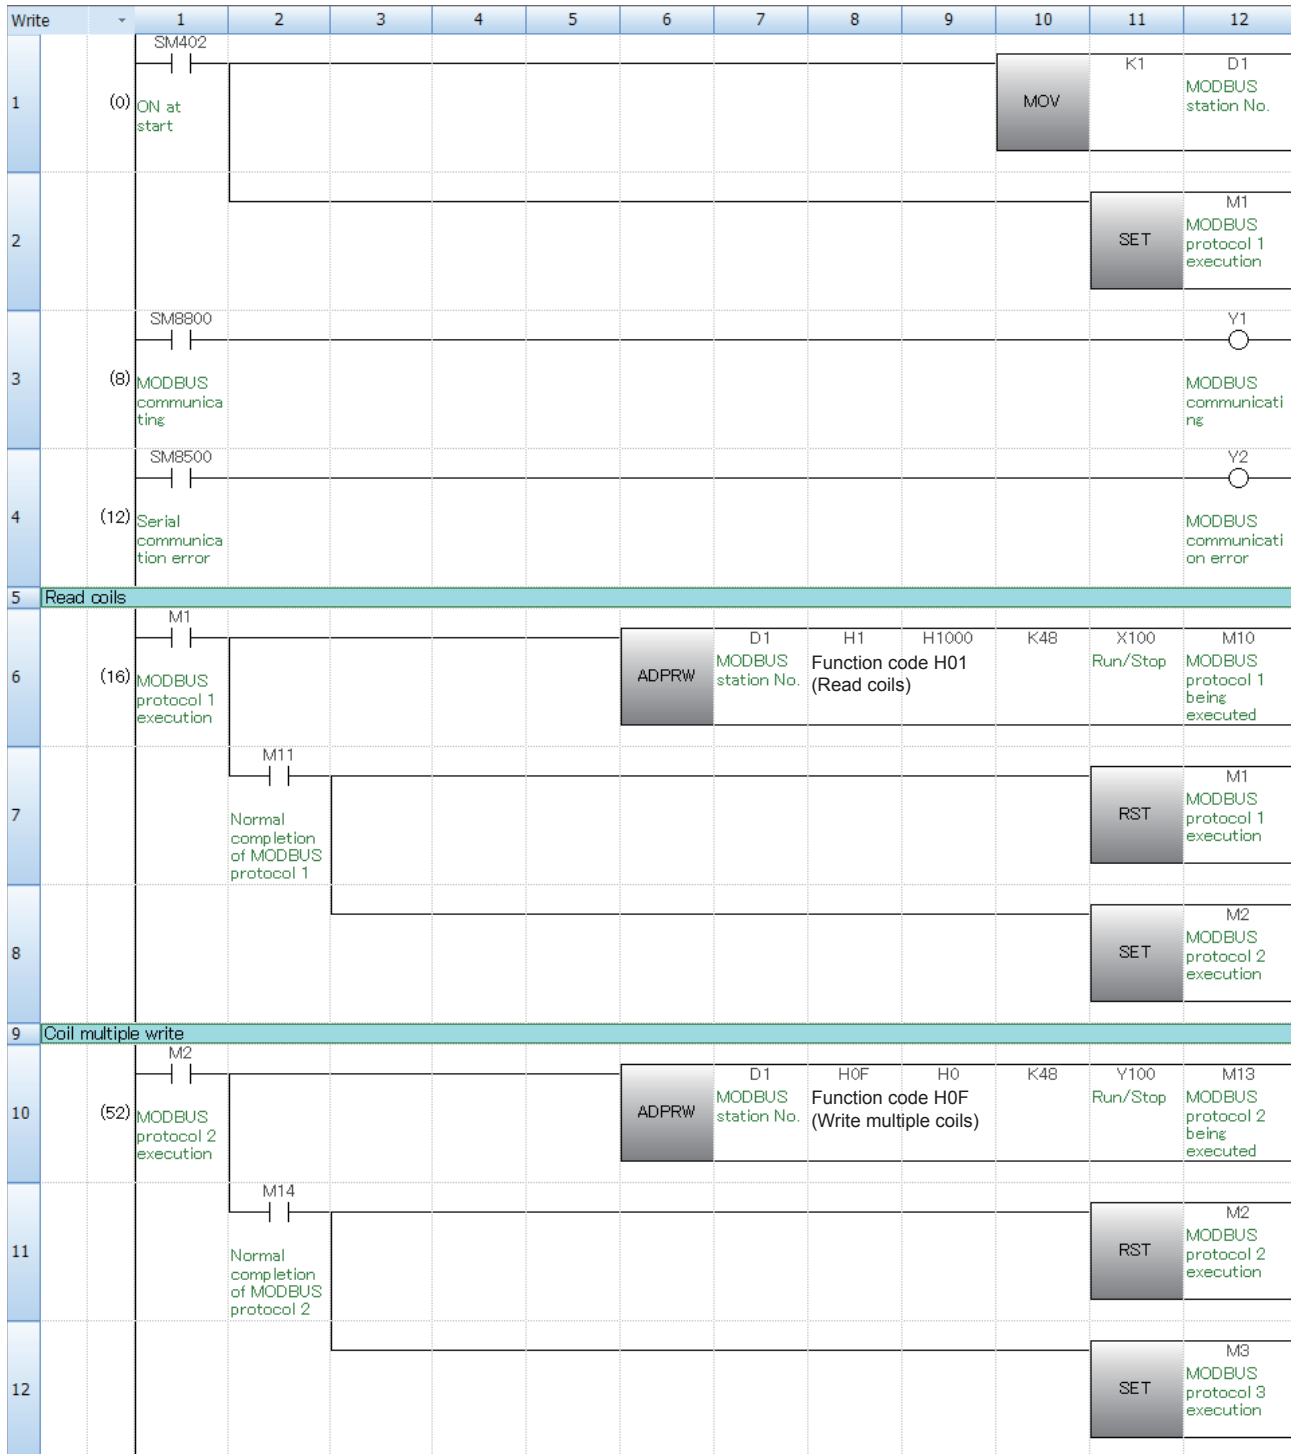

Latch setting

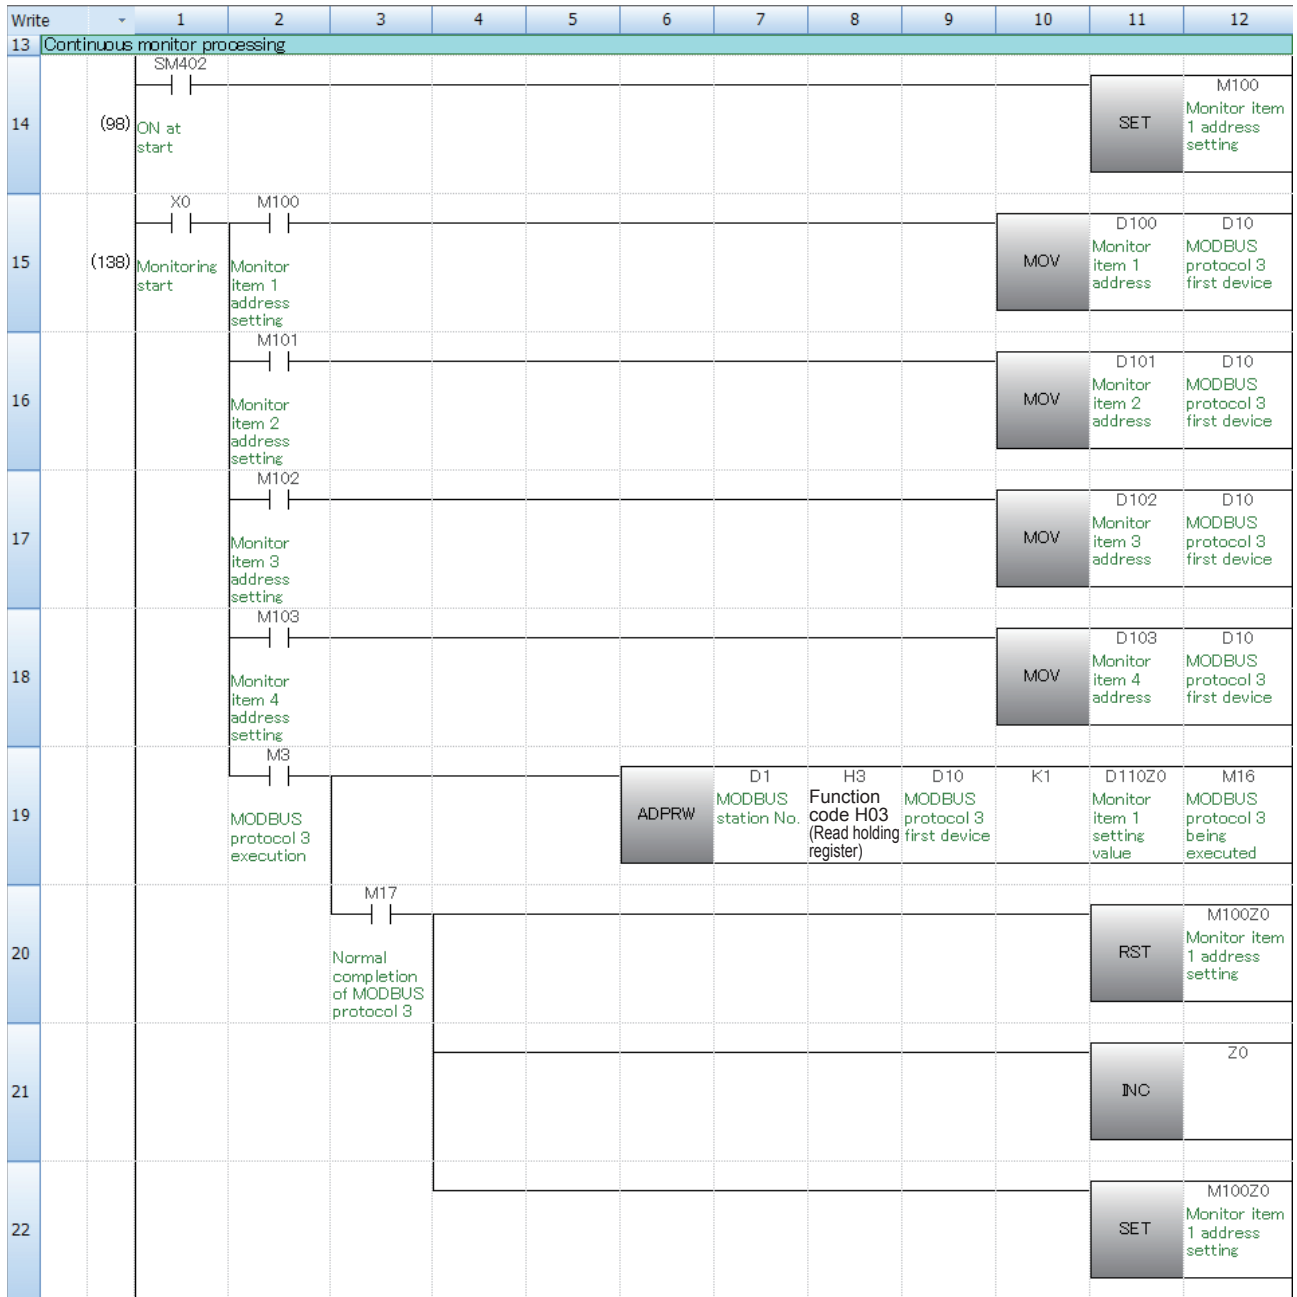

Item	Setting
Host station No.	Do not latch
Total number of local station	Do not latch

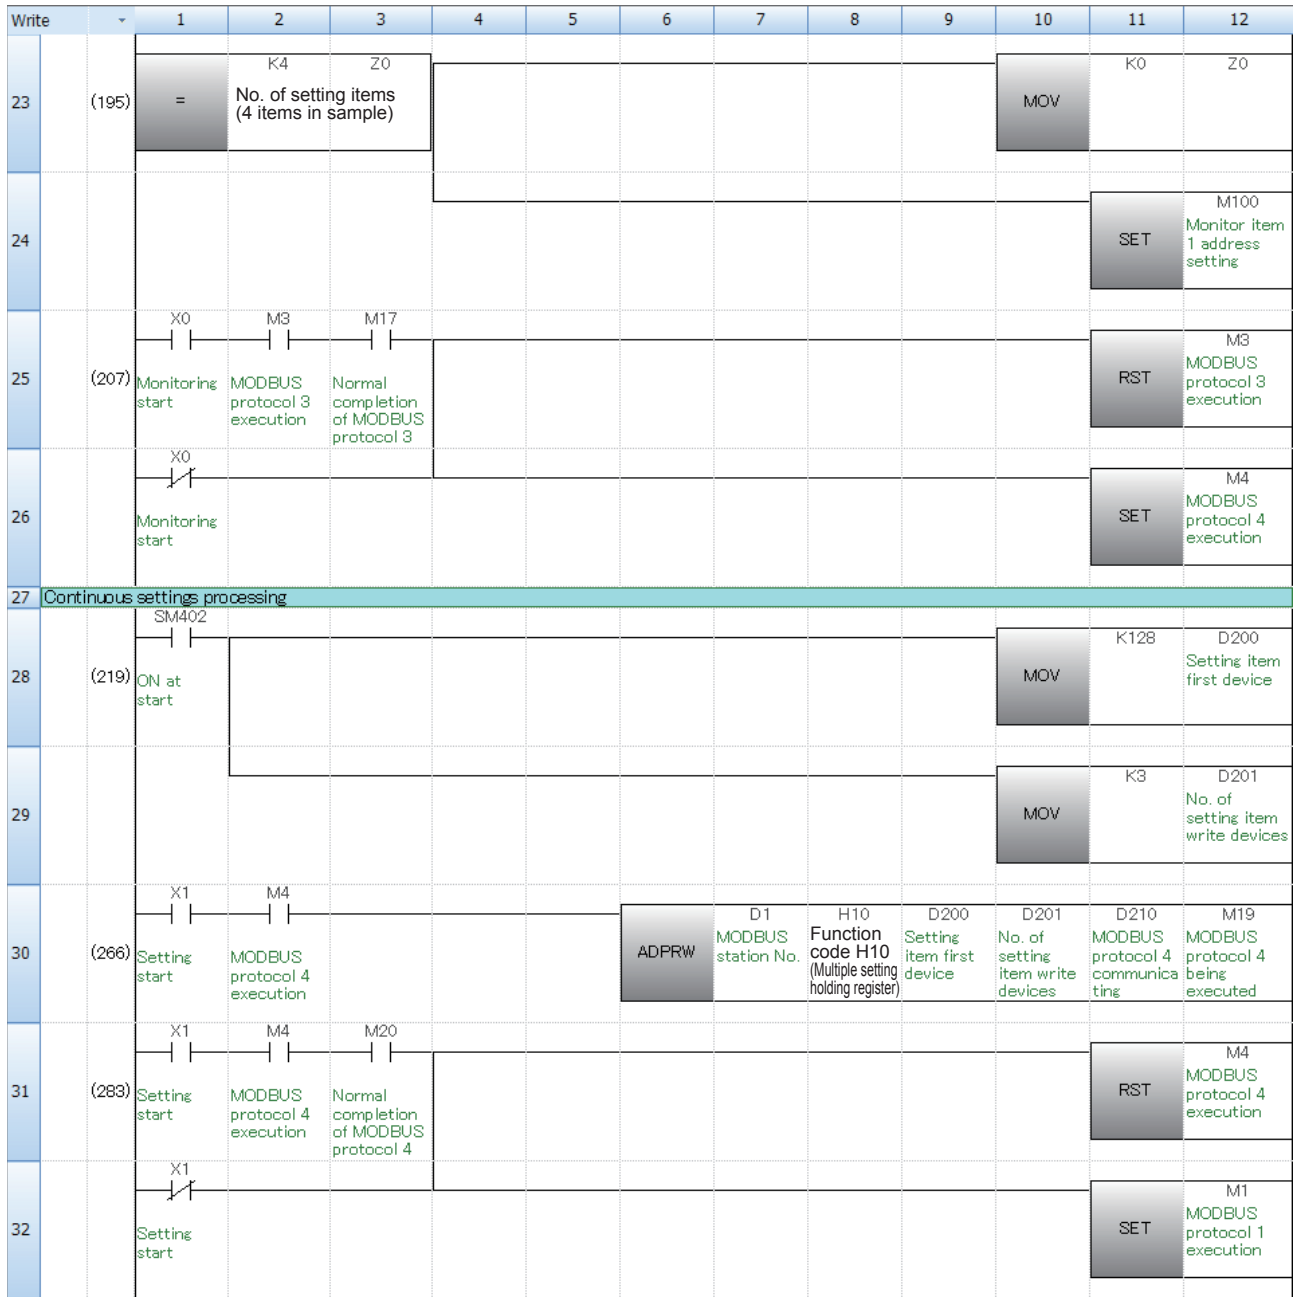

FX3 Series compatibility

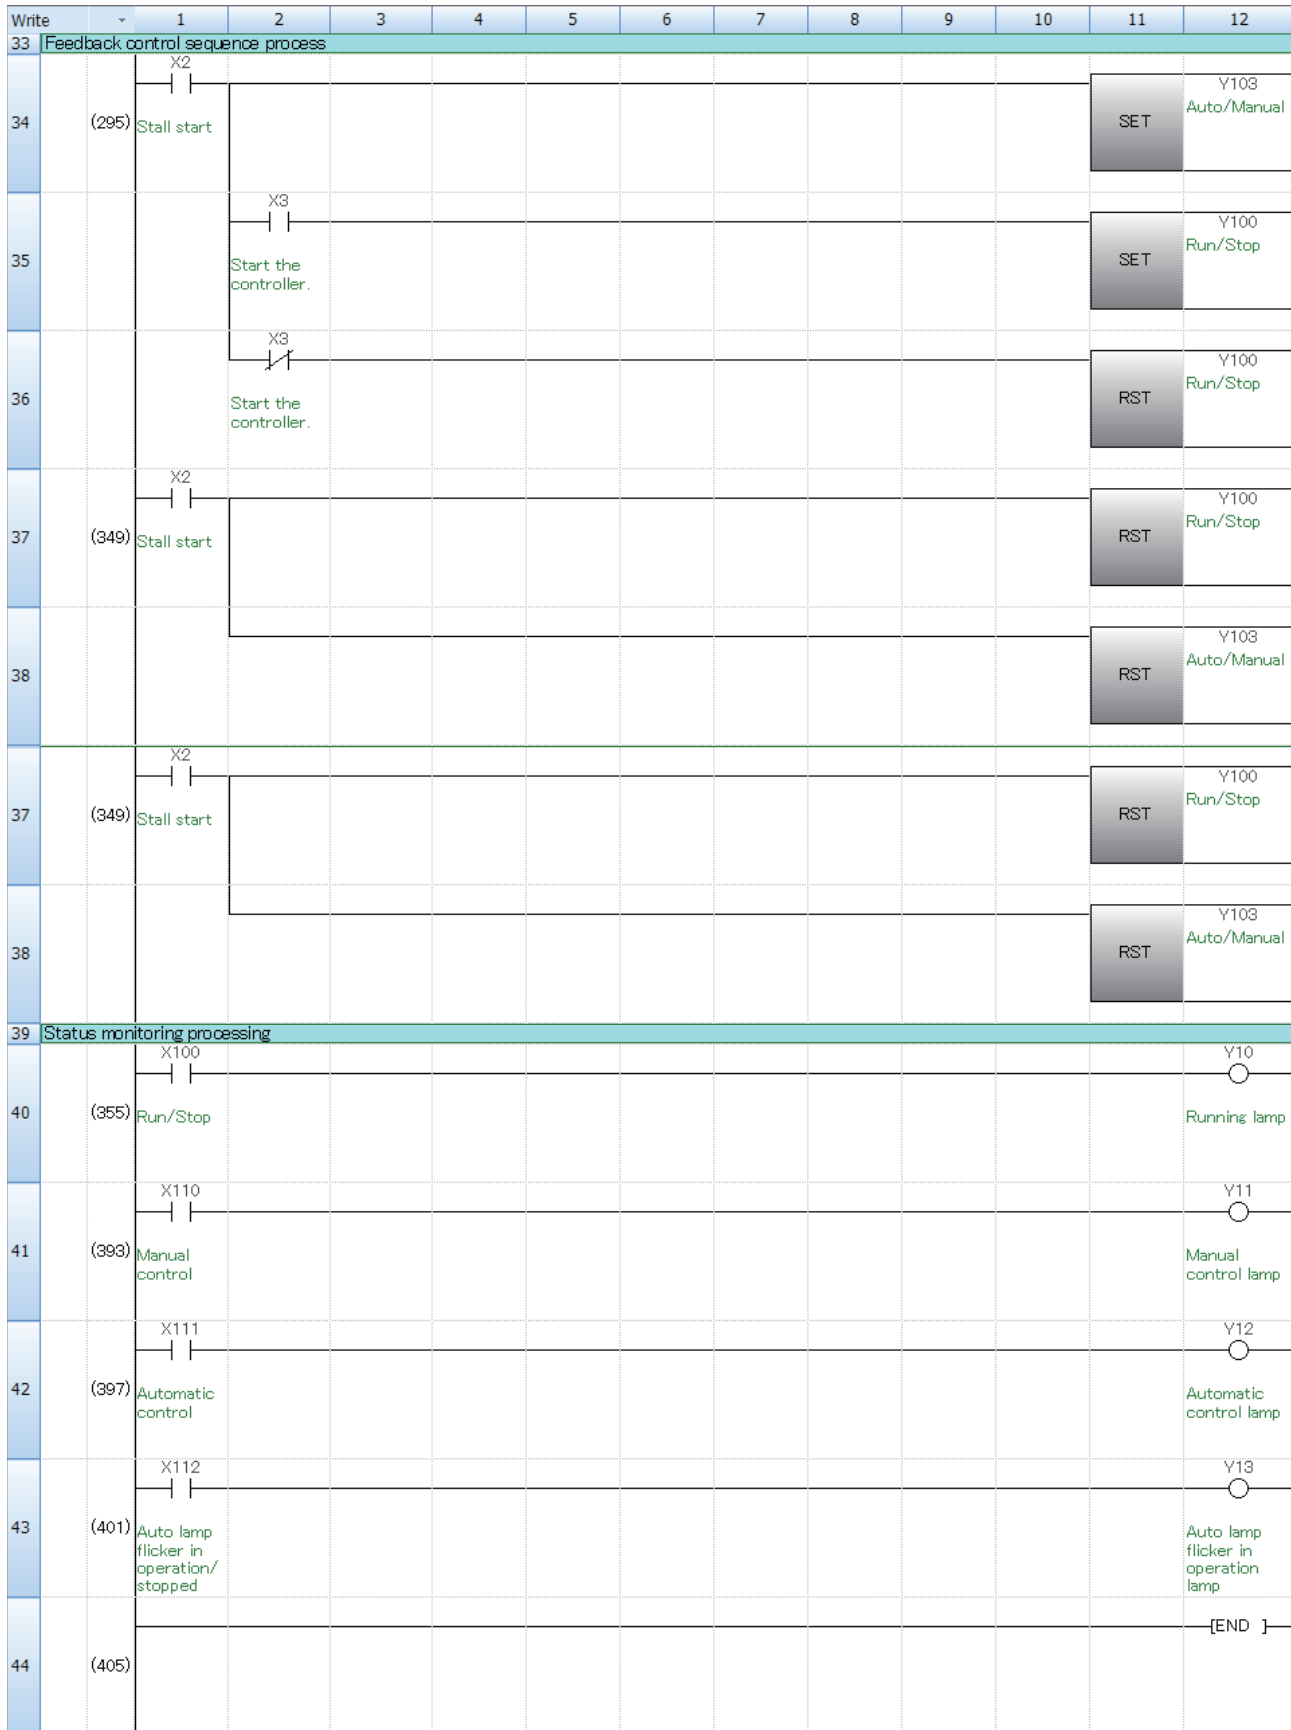

Item	Setting
SM/SD for compatibility	Disable

Program example

Using method of ladder

- Monitored items: By storing the device number of items to be monitored to D100 to D103, and setting X0=ON, the monitored values are stored in D110 to D113.
- Setting items: By inputting the first device of setting items to D200, inputting the number of written devices to D201, set X1=ON, and the setting values stored in D210 or later are stored.
- Feedback control: By turning ON/OFF X2 and X3, the control status is changed.?

List of used devices (The allocation is an example.)

Device name	Classification ^{*1}	Allocation function	Use
D100 to D104	Setting	Monitored item 1 to 4	Device set for individual access to each station No.
D200	Setting	Request command + request code/data setting 1 to 2	Device set to use the request command
X100 to 157	Monitoring	Input signal	Store ON/OFF status of input signal.
Y100 to 157	Setting	Output signal	Store ON/OFF status of output signal.
D1	Setting	MODBUS station No.	Device to specify the station No. (station No.=1 at all times in a sample)
D100 to D103	Setting	Address of monitored item 1 to 4	Set the device No. to be monitored.
D110 to D113	Setting	Set value of monitored value 1 to 4	Set value which is monitored in monitored item 1 to 4 is stored.
D200	Setting	Setting items first device	Set the first device of items to be set. (D128: tension setting in a sample)
D201	Setting	The number of setting items written devices	Set the number of items to be set. (the three items, D128 to D130 in a sample)
to D210	Setting	Setting items set value	Store the set value to be set. (The three devices, D210 to D212 are used in a sample.)
D120 to D123	Monitoring	Continuous monitor 1 to 4	Continuous monitor execution result is stored.
D130 to D131	Setting	Continuous setting 1 to 2	Setting value of continuous setting is stored.
X0	Setting	Start request command access execution	Execute request command.
X1	Setting	Start continuous monitor execution	Start to execute continuous monitor.
X2	Setting	Start continuous setting execution	Start to execute continuous setting.
X3	Setting	Start stall execution	Start to execute stall.
Y1	Monitoring	In MODBUS communication	Turn ON during the execution of MODBUS communication
Y2	Monitoring	MODBUS communication error	Turn ON during the MODBUS communication error.
Y10	Monitoring	Run	Run: ON/Stop: OFF
Y11	Monitoring	Manual control	Manual control ON
Y12	Monitoring	Automatic control	Automatic control ON
Y13	Monitoring	Auto lamp flicker in operation	Auto lamp flicker in operation ON
M1 to 4	System	ADPRW execution flag	Execute adapter instructions successively.
M10 to 22	System	ADPRW execution status flag	Store the execution result of adapter instructions.
M100 to M103	System	Address setting of monitored item 1 to 4	Set monitored item 1 to 4 successively.

*1 Classification

Setting: items to be set/input when using functions

Monitoring: items to monitor output when using functions
